**Fields** Mike Wördemann, 2012-05-16 The optical trapping of colloidal matter is an unequalled field of technology for enabling precise handling of particles on microscopic scales solely by the force of light. Although the basic concept of optical tweezers which are based on a single laser beam has matured and found a vast number of exciting applications in particular in the life sciences there are strong demands for more sophisticated approaches. This thesis gives an introductory overview of existing optical micromanipulation techniques and reviews the state of the art of the emerging field of structured light fields and their applications in optical trapping, micromanipulation and organisation. The author presents established and introduces novel concepts for the holographic and non-holographic shaping of a light field. A special emphasis of the work is the demonstration of advanced applications of the thus created structured light fields in optical micromanipulation utilising various geometries and unconventional light propagation properties. While most of the concepts developed are demonstrated with artificial microscopic reference particles the work concludes with a comprehensive demonstration of optical control and alignment of bacterial cells and hierarchical supramolecular organisation utilising dedicated nanocontainer particles      [Dissertation](#)

**Abstracts International**, 2006      **Recent Optical and Photonic Technologies** Ki Young Kim, 2010-01-01 Research and development in modern optical and photonic technologies have witnessed quite fast growing advancements in various fundamental and application areas due to availability of novel fabrication and measurement techniques, advanced numerical simulation tools and methods as well as due to the increasing practical demands. The recent advancements have also been accompanied by the appearance of various interdisciplinary topics. The book attempts to put together state of the art research and development in optical and photonic technologies. It consists of 21 chapters that focus on interesting four topics of photonic crystals first 5 chapters, THz techniques and applications next 7 chapters, nanoscale optical techniques and applications next 5 chapters and optical trapping and manipulation last 4 chapters in which a fundamental theory, numerical simulation techniques, measurement techniques and methods and various application examples are considered. This book deals with recent and advanced research results and comprehensive reviews on optical and photonic technologies covering the aforementioned topics. I believe that the advanced techniques and research described here may also be applicable to other contemporary research areas in optical and photonic technologies. Thus I hope the readers will be inspired to start or to improve further their own research and technologies and to expand potential applications. I would like to express my sincere gratitude to all the authors for their outstanding contributions to this book.
