Design and Implementation of a Database Programming Language for XML-based Applications Henrike Schuhart,2006 This publication focuses on two main aspects the seamless integration of XML and persistency concepts into the object oriented programming language Java XML is the de facto standard data exchange format between arbitrary applications There have been many efforts to integrate XML into programming languages reaching from the simple document object model DOM to whole XML class generators These approaches are available in most popular programming languages The integration of persistency into programming languages has been done by database programming languages as well as by certain new popular frameworks like Hibernate or approaches like EJB Nevertheless these approaches suffer from certain limitations concerning in particular transparency and object orientation While existing database programming languages integrate the relational model Hibernate and EJB 3 x does not support polymorphism in general EJB 2 x does not even support inheritance In addition although they try to the approaches except by some database programming languages are not transparent In this work transparency means that arbitrary types may become persistent Moreover algorithms remain unchanged whether they are executed on transient or persistent objects Finally users can work with persistency on a very high level Since there are so many currently developed frameworks trying to solve the integration problem of XML and persistency into object oriented programming languages the need for a holistic and transparent object oriented database programming language seems to be there The starting point of XOBEDBPL which stands for XML OBjEcts Database Programming Language is the predecessor project XOBE XOBE concentrates on the integration of XML objects and XPath as the query language for these objects The most important feature of XOBE is that each XML operation is statically type checked against the declared XML schema In XOBEDBPL the XML integration is extended regarding the manipulation of XML objects Before XML objects could only be queried but not updated The static type checking idea is kept and enhanced to include updates While XOBE s intentions lie on the development of web applications all objects can remain transient XOBEDBPL is supposed to deal with persistent objects as well

Real-Time & Stream Data Management Wolfram Wingerath,Norbert Ritter,Felix Gessert,2019-01-02 While traditional databases excel at complex queries over historical data they are inherently pull based and therefore ill equipped to push new information to clients Systems for data stream management and processing on the other hand are

natively push-oriented and thus facilitate reactive behavior. However, they do not retain data indefinitely and are therefore not able to answer historical queries. The book provides an overview over the different push-based mechanisms for data retrieval in each system class and the semantic differences between them. It also provides a comprehensive overview over the current state of the art in real-time databases. It first includes an in-depth system survey of today's real-time databases: Firebase, Meteor, RethinkDB, Parse, Bagend, and others. Second, the high-level classification scheme illustrated above provides a gentle introduction into the system space of data management. Abstracting from the extreme system diversity in this field, it helps readers build a mental model of the available options.

Java EE 5 Development Using GlassFish Application Server David R. Heffelfinger, 2007. This is a guide to developing Java EE 5 applications deployed to the high-performance Java EE 5 compliant GlassFish application server, which is quickly gaining massive popularity. After GlassFish installation and configuration, it covers application development, including all major Java EE 5 APIs: JSPs, JSTL, Servlets, and JSF for web applications; the Java Persistence API and JDBC to interact with RDBMS; EJB 3, including container-managed transactions and EJB declarative security through annotations; the JMS API for messaging; the JAAS API for secure applications; frameworks built on the Java EE 5 specification, including Seam, Facelets, and Ajax4jsf. It is aimed at Java developers wishing to become proficient with Java EE 5 who are expected to have some experience with Java and J2EE technologies and to have developed and deployed applications in the past but need no previous knowledge of Java EE and will teach the reader how to use GlassFish to develop and deploy applications.
