and competition of many artificial individuals. Robotics, artificial intelligence, artificial cognition, and group working try to create efficient models for collective intelligence in which it emerges from sets of actions carried out by more or less intelligent individuals. The major methodological, theoretical, and practical aspects underlying computational collective intelligence are group decision making, collective action coordination, collective competition, and knowledge description transfer and integration. Obviously, the application of multiple computational technologies such as fuzzy systems, evolutionary computation, neural systems, consensus theory, knowledge representation, etc. is necessary to create new forms of computational collective intelligence and support existing ones. Three subfields of application of computational technologies to support forms of collective intelligence are of special attention to us. The first one is semantic web, treated as an advanced tool that increases the collective intelligence in networking environments. The second one covers social networks modeling and analysis, where social networks are the area in which various forms of computational collective intelligence emerges in a natural way. The third subfield relates us to agent and multi-agent systems, understood as this computational and modeling paradigm which is especially tailored to capture the nature of computational collective intelligence in populations of autonomous individuals.

**Progress in Artificial Intelligence** José Maia Neves, Manuel Filipe Santos, José Manuel Machado, 2007-11-17. This book constitutes the refereed proceedings of the 13th Portuguese Conference on Artificial Intelligence EPIA 2007 held in Guimarães, Portugal in December 2007 as eleven integrated workshops. The 58 revised full papers presented were carefully reviewed and selected from a total of 210 submissions. In accordance with the eleven constituting workshops, the papers are organized in topical sections on a broad range of subjects.

**Applying Predictive Analytics** Richard V. McCarthy, Mary M. McCarthy, Wendy Ceccucci, 2022-01-01. The new edition of this textbook presents a practical, updated approach to predictive analytics for classroom learning. The authors focus on using analytics to solve business problems and compares several different modeling techniques, all explained from examples using the SAS Enterprise Miner software. The authors demystify complex algorithms to show how they can be utilized and explained within the context of enhancing business opportunities. Each chapter includes an opening vignette that provides real life examples of how business analytics have been used in various aspects of organizations to solve issues or improve their results. A running case provides an example of how to build and analyze a complex analytics model and utilize it to predict future outcomes. The new edition includes chapters on clusters and associations and text mining to support predictive models. An additional case is also included that can be used with each chapter or as a semester project.
