

Mechanism of Reaction in Aromatic Compounds

Final Cycle Diagram - easy way to predict substituted aromatic compounds for electrophilic aromatic substitution.

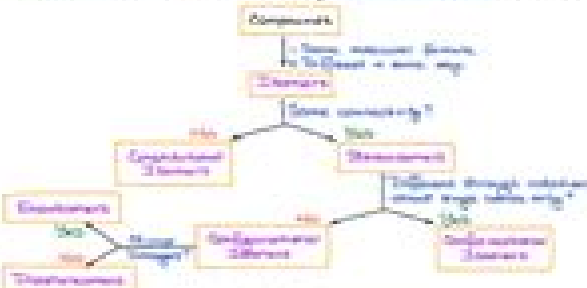

A cyclic compound is considered in a circle, with a point above the circle.

Due to the resonance, the positive charge of the sigma complex is delocalized over the ortho and para positions.

Summary of Stereochemical Relationships

- Constitutional Isomers:** completely different molecules.
- Conformational Isomers:** same molecule that only differ in 3D-structure due to free rotation around single bonds.
- Enantiomers:** non-superimposable mirror images that share physical & chemical properties in achiral environment.
- Diastereomers:** non-superimposable, non-mirror images that have different physical & chemical properties.
- Meso Compounds:** non-chiral due to the plane of symmetry, however, have chiral centers.

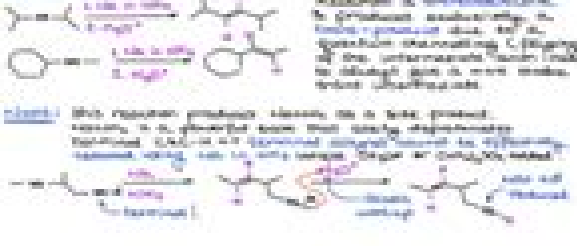

Stereochemical Relationship of Enantiomers

Enantiomers are mirror images, non-superimposable, and share the same physical & chemical properties in achiral environment. They are separated by chiral reagents, chromatography, or crystallization, resulting in two enantiomers separating their optical activity, which is a chiral property, into original molecules.
