addresses the benefits of drawing down nitrous oxide N₂O emissions N₂O is now the most significant ozone depleting substance emission and the third most important greenhouse gas released into the atmosphere Global anthropogenic N₂O emissions are rapidly increasing and are expected to almost double by 2050 unless mitigation action is accelerated The continued build up of N₂O in the atmosphere will continue to deplete the stratospheric ozone layer and in so doing will to a degree undermine the achievements of the Montreal Protocol The build up of N₂O will also make it more difficult to achieve climate targets Two thirds of current anthropogenic N₂O emissions originate from agriculture and these can be reduced by boosting nitrogen use efficiency especially by making the use of fertilizer manure and feed more efficient Improving nitrogen use efficiency can be accomplished through a wide variety of feasible options Who's Who in Science and Engineering
