The control of customer returns Edgar Howard Gault, 1942 Many Happy Returns Tiina Harris, 1988-09-01 Operational and Economical Perspectives on Consumer Returns Gülay Samatlı-Paç, 2013 Customer return policies are one of common after-sale services offered by a retailer in order to boost sales, improve customer satisfaction and diminish customer fit uncertainty. With such a service, the retailer accepts the return of a product after the sale has occurred if it does not satisfy the customer.

s expectations This study investigates consumer returns from three different perspectives First we start with a single period inventory planning problem of multi variants in which customers have a right to return products in case of dissatisfaction We assume that returns can be as good as new condition after a minor restocking process and they are resalable in the same selling period At the time of purchasing a customer may choose to substitute her choice with another variant of the item if the former is sold out This so called substitution and resalable returns are important parameters in assortment planning that might affect the total profit dramatically Under this setting we aim to illustrate the effect of return and substitution on the optimal order quantities of variants and the total expected profit We show that the total profit decreases as the probability of returns or the probability of resalable returns increases In addition the probability of substitution return or resalable return has a negative effect on inventory level of variants Second we analyze a retailer s return policy problem when the market consists of loss averse customers who are more sensitive to losses than gains instead of being risk neutral customers We examine the situation in which a seller makes price and quantity decisions for a single item and also designs an appropriate returns policy in order to maximize his profit We analyze the case where the seller offers either a full refund or a partial refund policy if he decides to accept returns or chooses not to accept any returns With the full refund policy the seller reimburses the consumer the full price of the product if it does not fit the customer s preferences With a partial refund policy the seller offers a refund which is strictly less than the purchase price We assume that customers are strategic customers aiming to maximize their utilities of the product With this model we aim to analyze the impact of loss aversion on the seller s price and order quantity decisions We show that the seller keeps fewer inventories as customers get more loss averse and loss aversion has a negative effect on the expected unit profit Thus the total profit decreases as loss aversion Finally we present a model that investigates the effects of return policies on each of the two sellers pricing decisions when these sellers engage in market size competition Our model simultaneously addresses a consumer s purchase decision and the competing sellers price decisions along with their respective return policies We assume that two competing sellers which do not have a capacity problem only decide their prices and return policies The sellers may independently offer no refund full refund of the price of the product or a partial refund The market share of each party depends on his and the rival s price and return policy customer valuations of the product and the degree of competition between the sellers Before purchasing a consumer cannot evaluate the product s utility which is a decreasing function of the price set by the seller from which she chooses to purchase it and the disutility of purchase and or return which is related to the physical distance between the consumer and the seller s location The return policy of a seller may also affect a consumer s decision via her expected utility Thus pricing and return policy decisions play an important role in the division of the total market We show that the full refund policy yields a higher purchasing price compare to the no refund or partial refund policy However it only performs better in terms of profit when the product has a small salvage value and a partial refund policy is not an option for the retailer When the retailer offers the

partial refund policy it always dominates the other refund policies In addition we show that the full refund policy provides the highest consumer surplus since customers do not face any risk of misfit On the other hand the full refund policy is socially efficient only when the salvage value is high For low salvage values the partial refund policy yields a higher level of social welfare

How E-commerce Companies Can Reduce Returns Pedro Amorim, Eduard Calvo, Laura Wagner, 2023 Online retailers frequently assume that pleasing customers requires shipping each item in an order as quickly as possible rather than assembling the entire order and delivering a consolidated shipment But new research with an online fashion marketplace found that customers receiving consolidated shipments were less likely to return items lowering the retailer's logistics costs and improving sales The authors suggest how to adapt fulfillment strategies in light of their findings

Refund Or Not? Joint Pricing and Refund Optimization for Omnichannel Retailing with Product Returns Yi Meng Sun, 2023 Problem definition We consider an omnichannel retailer selling multiple substitutable products through an online channel and a physical store Online purchases can be returned either by mail or to the physical store The retailer decides each product's price and refund value for each channel to maximize his expected profit Methodology results We capture a consumer's sequential decisions on making a purchase and potentially returning her product using a generalized Markovian logit choice MLC model We use this model to formulate a joint pricing and refund optimization problem for the retailer If there are no constraints on prices and refund values this problem is convex and we obtain analytical expressions of its optimal solution Otherwise the problem may become non convex and we approximate it using a mixed integer linear program We estimate the generalized MLC model using transaction data that may only be partially observable making our framework applicable to a data driven setting Numerical experiments using synthetic data demonstrate that our estimation and optimization framework based on this generalized MLC model fits a general data set well and produces competitive results A case study using data with some unobservable consumer choices from a major fashion retailer demonstrates that our joint pricing and refund optimization approach significantly outperforms heuristics commonly used in practice Managerial implications To benefit from return policies the retailer needs to guarantee good quality or non negative online or offline return social welfare for each product Under the cross channel substitution effect the optimal online and offline prices can move in opposite directions and the rise of any product's offline cost makes the retailer more willing to offer the return policies for online purchases
