Abstract—Cloud Computing is a Service Delivery Mechanism. Computing resources are delivered as a service over the network. These services are Scalable, Autonomous, and Cost effective in nature. Cloud Computing is responsible for the exponential growth of IT Industry. In spite of having so many advantages it has various security challenges that cannot be ignored. In order to make the Cloud Computing all the more secure and reliable some steps has to be taken against the threats of Cloud Computing model. In this paper all the threats related to Cloud Computing is discussed along with their possible solutions.

Keywords—Cloud Computing Security; Cloud Threats; Challenges in Cloud

I. INTRODUCTION

Cloud Computing is the use of computing resources including hardware and software that are delivered as a service over a network. In other words Cloud computing can be defined as a new style of computing in which dynamically Scalable and often virtualized resources are provided as a services over the Internet. With the cloud computing technology, users use a variety of devices, including PCs, laptops, smartphones, and PDAs to access programs, storage, and application-development platforms over the Internet, via services offered by cloud computing providers. Cloud Computing is categorized in two ways one is with deployment model and the other is service delivery model

Deployment models of the cloud are:

Private Cloud: Private Clouds are provided by an organization or their designated service provider and offer a single-tenant (dedicated) operating environment with all the benefits and functionality of elasticity and the accountability/utility model of Cloud.

Public Cloud: Public Clouds are provided by a designated service provider and may offer either a single-tenant (dedicated) or multi-tenant (shared) operating environment with all the benefits and functionality of elasticity and the accountability/utility model of Cloud.

Community Cloud: Community Clouds are provided by a designated service provider related to a particular community and may offer either a single-tenant (dedicated) or multi-

tenant (shared) operating environment with all the benefits and functionality of elasticity and the accountability/utility model of Cloud.

Hybrid Cloud: Hybrid Clouds are a combination of public and private cloud offerings that allow for transitive information exchange and possibly application compatibility and portability across disparate Cloud service offerings and providers, utilizing standard or proprietary methodologies regardless of ownership or location.

Service delivery model of the cloud are:

Software as a Service (SaaS): The capability provided to the consumer is to use the provider's applications running on a cloud infrastructure and accessible from various client devices through a thin client interface such as a Web browser (e.g., web-based email).

Platform as a Service (PaaS): The capability provided to the consumer is to deploy onto the cloud infrastructure consumer-created applications using programming languages and tools supported by the provider (e.g., java, python, .Net).

Infrastructure as a Service (IaaS): The capability provided to the consumer is to rent processing, storage, networks, and other fundamental computing resources where the consumer is able to deploy and run arbitrary software, which can include operating systems and applications.

The contribution of this paper is mainly focused on to improve the security of the cloud environment in order to make the cloud all the more secure and reliable. Through this paper we have tried to convey the idea that the security of the cloud is the responsibility of both provider and consumer depending upon the layer and architecture of the cloud under consideration. We have cited various threats of the cloud and their solutions as well. The specific contributions of this paper are as follows:

- Implementation of Isolation and Segmentation techniques of computing resources can overcome the problem of multi-tenant architecture that shares the same instance of resources with multiple users.

New Concepts and Applications in Soft Computing Valentina Emilia Balas, János Fodor, Annamária R. Várkonyi-Kóczy, 2012-07-20 The book provides a sample of research on the innovative theory and applications of soft computing paradigms The idea of Soft Computing was initiated in 1981 when Professor Zadeh published his first paper on soft data analysis and constantly evolved ever since Professor Zadeh defined Soft Computing as the fusion of the fields of fuzzy logic FL neural network theory NN and probabilistic reasoning PR with the latter subsuming belief networks evolutionary computing including DNA computing chaos theory and parts of learning theory into one multidisciplinary system As Zadeh said the essence of soft computing is that unlike the traditional hard computing soft computing is aimed at an accommodation with the pervasive imprecision of the real world Thus the guiding principle of soft computing is to exploit the tolerance for imprecision uncertainty and partial truth to achieve tractability robustness low solution cost and better rapport

Cloud computing is an emerging discipline that is changing the way corporate computing is and will be done in the future Cloud computing is demonstrating its potential to transform the way IT based services are delivered to organisations There is little if any argument about the clear advantages of the cloud and its adoption can and will create substantial business benefits through reduced capital expenditure and increased business agility However there is one overwhelming question that is still hindering the adaption of the cloud Is cloud computing secure The most simple answer could be Yes if one approaches the cloud in the right way with the correct checks and balances to ensure all necessary security and risk management measures are covered as the consequences of getting your cloud security strategy wrong could be more serious and may severely damage the reputation of organisations **Cloud Computing Security** John R.
