2.5 Membrane Permeability

What Can Cross the Membrane?

Types of molecules that cross the membrane:

- Small nonpolar molecules** (like O_2 and CO_2) can diffuse directly through the phospholipid bilayer without any help. These molecules are small and nonpolar.
- Small polar uncharged molecules** (like water) can diffuse through the membrane in small amounts. These molecules are small enough that they can slip between phospholipids, but they are polar and can form hydrogen bonds with water.
- Large polar molecules and ions** (like glucose, amino acids, Na^+ , K^+ , and Cl^-) cannot cross the membrane on their own. They need transport proteins to help them cross. These molecules and ions typically cross through transport proteins in the membrane.

The hydrophobic tails of the phospholipids are the main barrier to the movement of molecules across the membrane. They are nonpolar and repel water and other polar molecules.

How Different Molecules Cross the Membrane

Molecule Type	Examples	Can Cross Easily?	Needs Transport Protein?
Small nonpolar	O_2 , CO_2 , N_2	Yes	No
Small polar uncharged	Water	Yes (limited)	No (large amounts)
Large polar	Glucose, amino acids	No	Yes
Ions	Na^+ , K^+ , Cl^-	No	Yes

1.5 Representing a Quantitative Variable with Graphs

Remember that a **quantitative variable** (or **quantitative variable**) refers to variables that can be measured and are numerical values. Quantitative variables can be discrete or continuous.

- A **discrete variable** can take on a limited number of values. The number of children in a family is a discrete variable. Examples of discrete variables include the number of children in a family, the number of votes in an election, and the number of cars in a parking lot.
- A **continuous variable** can take on an infinite number of values. Height, weight, and time are continuous variables. Examples of continuous variables include the height of a person, the weight of a person, and the time it takes to run a mile.

This page will describe how to represent and display quantitative data. The following table is a summary of the key concepts you need to know for this topic. The goal is to help you understand the key concepts and how to represent them with graphs. The table is divided into two main sections: **Discrete Variables** and **Continuous Variables**. Each section contains a list of key concepts and a description of how to represent them with graphs.

2.5 The Demographic Transition Model

Remember the Demographic Transition Model? It was a major event in the history of the American Revolution. It was the first time that a colony in the Americas successfully overthrew its European rulers and established an independent nation.

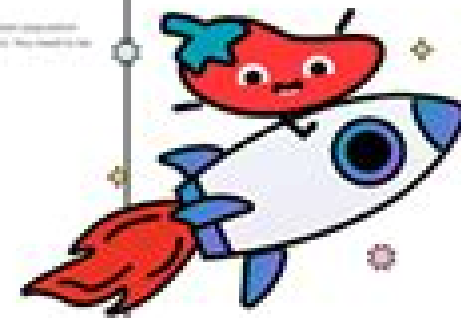

Demographic Transition Model

The Demographic Transition Model (DTM) is a model that describes the changes in the size and structure of a population over time. It is based on the idea that a population will go through four stages of development: Stage 1, Stage 2, Stage 3, and Stage 4.

Stage 1

Stage 1 is the initial stage of the DTM. It is characterized by a high birth rate and a high death rate. The population is small and the growth is slow. The birth rate is high because of a lack of family planning and the death rate is high because of a lack of medical care.
