Clean Disruption of Energy and Transportation

Tony Seba, 2014-06-27 The industrial age of energy and transportation will be over by 2030. Maybe before. Exponentially improving technologies such as solar electric vehicles and autonomous self-driving cars will disrupt and sweep away the energy and transportation industries as we know it. The same Silicon Valley ecosystem that created bit-based technologies that have disrupted atom-based industries is now creating bit and electron-based technologies that will disrupt atom-based energy industries. Clean Disruption projections based on technology cost curves, business model innovation as well as product innovation show that by 2030 all new energy will be provided by solar or wind. All new mass market vehicles will be electric. All of these vehicles will be autonomous self-driving or semi-autonomous. The new car market will shrink by 80%. Even assuming that EVs don't kill the gasoline car by 2030, the self-driving car will shrink the new car market by 80%. Gasoline will be obsolete. Nuclear is already obsolete. Up to 80% of highways will be redundant. Up to 80% of parking spaces will be redundant. The concept of individual car ownership will be obsolete. The Car Insurance industry will be disrupted. The Stone Age did not end because we ran out of rocks. It ended because a disruptive technology ushered in the Bronze Age. The era of centralized command and control extraction resource-based energy sources: oil, gas, coal, and nuclear will not end because we run out of petroleum, natural gas, coal, or uranium. It will end because these energy sources, the business models they employ, and the products that sustain them will be disrupted by superior technologies, product architectures, and business models. This is a technology-based disruption reminiscent of how the cell phone, Internet, and personal computer swept away industries such as landline telephony, publishing, and mainframe computers. Just like those technology disruptions flipped the architecture of information and brought abundant, cheap, and participatory information, the clean disruption will flip the architecture of energy and bring abundant, cheap, and participatory energy. Just like those previous technology disruptions, the Clean Disruption is inevitable and it will be swift.

The Truth About Energy John K. White, 2024-02-08 The transition to renewable energy is vital and fast-paced, but how do we choose which technologies to drive this energy transition? This timely book provides everyone interested in the renewable energy transition with an introduction to and technical foundation for understanding modern energy technology. It traces everyday power generation through history from the Industrial Revolution to today. It examines the use of wood, coal, oil, natural gas, hydro, and nuclear to produce energy before discussing renewable energy sources such as biomass, photovoltaics, concentrated solar power, wind, wave, and geothermal. The book examines to what extent and how each technology can contribute to a clean green infrastructure. The Truth About Energy explains the science and engineering of energy to help everyone understand and compare current and future advances in renewable energy, providing the context to critically examine the different technologies that are competing in a fast-evolving engineering, political, and economic landscape.

Illustrated Electrical Review, 1894 **Electronics World + Wireless World**, 1992 *Speed Control of Interior Permanent Magnet Synchronous Machine* Jigneshkumar Desai, 2022-09-27. Document from the year 2022 in the subject Engineering General grade 12 language English abstract. The creation of a simulation model for closed loop vector controlled IPMSM drive performance enhancement and speed control is described in this book. By regulating the torque component of the current, the model achieves superior speed tracking and rapid dynamic response under transient and steady state circumstances. The control technique is used by both the proportional and integrated controllers in the PI controller. Combining two independent controllers and reducing the

shortcomings of each results in a more effective controller To offer optimal speed operation in the face of environmental changes load variations and structural disturbances the Fuzzy Logic Controller for PMSM must be properly constructed Using MATLAB Simulink this book gives a comprehensive simulation of an internal permanent magnet synchronous motor driving system Interior permanent magnet synchronous motors IPMSMs are used to improve machine performance and offer rapid torque response IPMSMs are utilised in low and medium power applications such as servos robotics variable speed motors electric vehicles and computer peripherals Because PM motor drives are becoming more popular simulation systems capable of handling motor drive simulations are in great demand Simulation tools can dynamically simulate motor drives in a visual environment saving money and time and easing the development of new systems High Performance Computing Julian M.
