Maul,1989 *A Disaggregate Negative Binomial Regression Procedure for Count Data Analysis* Venkatram Ramaswamy,Eugene Anderson,Wayne S. DeSarbo,2016 Various research areas face the methodological problems presented by nonnegative integer count data drawn from heterogeneous populations We present a disaggregate negative binomial regression procedure for analysis of count data observed for a heterogeneous sample of cross sections possibly over some fixed time periods This procedure simultaneously pools or groups cross sections while estimating a separate negative binomial regression model for each group An E M algorithm is described within a maximum likelihood framework to estimate the group proportions the group specific regression coefficients and the degree of overdispersion in event rates within each derived group The proposed procedure is illustrated with count data entailing nonnegative integer counts of purchases events for a frequently bought consumer good Consistency for the Negative Binomial Regression with Fixed Covariate Rafael Weißbach,Lucas Radloff,2018 *Consistency for the Negative Binomial Regression with Fixed Covariate* Rafael Weißbach,Lucas Radloff,2018 Negative Binomial Regression for Analysis of Aggregated Morbidity Data Dorte Kronberg,Søren Tolver Jensen,Anne K. MES,1997 **Poisson Versus Negative Binomial Regression in the Analysis of Count Data** Barbie Ann L. Bugna,2015 Commonly used tests for treatment effect in kx2 frequency data are Poisson regression negative binomial regression and Cochran Mantel Haentzel In practice Poisson regression or CMH is used as default and NB regression is used only when there is reason to believe the data has overdispersion beyond what is expected of Poisson counts We show that the Poisson regression is sensitive to the Poisson assumption and does not maintain its size in the presence of overdispersion In particular it tends to interpret overdispersion as significant treatment effect Thus there is a need for a reliable pretest for the Poisson assumption A commonly used diagnostic for overdispersion is a Wald test of the estimated overdispersion parameter however this has convergence problems We propose a simpler Hogg type diagnostic that has no convergence problems and is easy to compute

The Relative Performance of Poisson and Negative Binomial Regression Estimators McKinley L. Blackburn,2015 Negative binomial estimators are commonly used in estimating models with count data dependent variables In this paper sampling experiments are used to evaluate the performance of these estimators relative to the simpler Poisson estimator in

finite sample situations The results do not suggest a clear preference for negative binomial estimators in situations in which the underlying dependent variables are overdispersed unless the researcher is comfortable in assumptions about the precise form of the overdispersion Econometric Analysis of Health Data Andrew M. Jones,Owen O'Donnell,2002-05-17 Given extensive use of individual level data in Health Economics it has become increasingly important to understand the microeconometric techniques available to applied researchers The purpose of this book is to give readers convenient access to a collection of recent contributions that contain innovative applications of microeconometric methods to data on health and health care Contributions are selected from papers presented at the European Workshops on Econometrics and Health Economics and published in Health Economics Topics covered include Latent Variables Unobservable heterogeneity and selection problems Count data and survival analysis Flexible and semiparametric estimators for limited dependent variables Classical and simulation methods for panel data Publication marks the tenth anniversary of the Workshop series Doctoral students and researchers in health economics and microeconomics will find this book invaluable Researchers in related fields such as labour economics and biostatistics will also find the content of use **Applied Survey Data Analysis** Brady T.
