Network and System Security Pramod Pandya,2013-08-26 With an ever increasing amount of information being transmitted electronically it is important that security be considered in every phase of local area network design and maintenance Although much emphasis has been placed on such things as wireless networks and remote access it is imperative that the core local area network not be overlooked Because the wired local area network is the nervous system of

an organization's Information Systems great care must be taken to properly secure it This chapter begins by looking at the implications for the wired local area network infrastructure security Next local area network segmentation and traffic isolation will be discussed By using segmentation and isolation there is the increased opportunity for security boundaries Another concept that will be discussed is the security of the local area network equipment The local area network is only functional if the core equipment is operational so securing equipment is an important part of any security strategy To conclude restriction of local area network access will be investigated and an organizational approach will be discussed Because more and more users need access to local area network resources there must be a way to identify and restrict who is allowed on the network and what access they are granted In wired local area network infrastructure security organizations must remember they are only as secure as their weakest point By carefully considering the various aspects of the local area network security during design these weak points can be reduced and the overall security of the network increased Although it is impossible to be 100% secure and still be functional by using some general guidelines to secure the wired local area network many threats to the network can be reduced if not eliminated

Network and System Security Bill Mansoor,2013-08-26 Many organizations encounter a common problem in their approach to intranet security They treat intranets as an internal tool that is hidden deep in the corporate network and is somehow immune from external attacks This is far from the truth however An intranet is basically a Web application exposed to a hostile environment the same way as the corporate Web site and therefore vulnerable to the same scope of threats The fact that it is intended for employees and trusted parties doesn't guarantee anything against hacker attacks viruses and spam Failing to introduce a dedicated intranet security policy entails

a range of risks associated with sensitive information leakage and data loss For many organizations safeguarding intranets is even more important than protecting their Web sites Intranets usually contain extremely confidential assets crucial for both day to day activity and strategic business development A successful attack may result in disruption of the organization s operations significant reputation damage and infringement of legal regulations To avoid unexpected embarrassment after launching an intranet organizations must carefully evaluate the solution s capability to cope with security issues So with the preceding in mind this chapter provides information about all aspects of threats that affect intranet security The chapter is intended for organizations that understand the changing nature of the threat landscape and what might be done to mitigate it
