Epilepsy in Children, 2E Sheila J Wallace, Kevin Farrell, 2004-02-27. Epilepsy is the most common neurological disorder of childhood occurring both in children whose physical and cognitive states are otherwise normal as well as being a facet of a more generalised and severe brain disease. There are many manifestations of epilepsy and therefore a diversity of factors in underlying pathology, responses to treatment. Pediatric epilepsy surgery, 2009. *Childhood Seizures* S. Shinnar, N. Amir, D. Branski, 1994-12. *Handbook of Pediatric Epilepsy*, 2016-07-10. Epilepsy is the most common neurological problem affecting children and adolescents with an incidence rate of 1-2%. Diagnosing epilepsy in children is often complicated by age dependent manifestations which can differ greatly from seizure disorders seen in adults. Thus effective treatment and management depends on clinicians to establish an accurate diagnosis and choose appropriate therapy based on the likelihood of clinical benefit. *Handbook of Pediatric Epilepsy* will be a concise overview of seizures in infants, children and adolescents including a discussion of common types of seizure disorders, treatment options, recent drug developments and evidence based

disease management guidelines *Childhood Epilepsy* Richard Appleton, Peter Camfield, 2011-07-28 Sixty percent of the epilepsies start in childhood and most of the clinically significant and often life changing aspects of the disease occur at this time Childhood epilepsy is frequently a complex disorder demanding integrated medical educational and community services Its treatment encompasses acute and disability medicine The many types or syndromes of childhood epilepsy present both diagnostic and management challenges Although many children with epilepsy will be referred to specialist units the majority will initially present to paediatricians and paediatric neurologists This book provides a practical problem oriented manual to help clinicians with diagnosis evaluation and management This book addresses epilepsy as an evolving disorder from presentation through active disease and finally to either spontaneous remission or a chronic lifelong condition Structured on the child's age at presentation Childhood Epilepsy offers a practical overview for paediatricians paediatric neurologists and primary care practitioners who treat children with epilepsy in their daily practice **Epilepsy in Children** Zeljka Petelin Gadze, 2011-09-15 Epilepsy is a neurological condition that accompanies mankind probably since its inception About 400 years before Christ the disease was already known by Hippocrates who wrote the book On The Sacred Disease Classically epilepsy has been defined as a chronic condition characterized by an enduring propensity to generate seizures which are paroxysmal occurring episodes of abnormal excessive or synchronous neuronal activity in the brain Out of all brain disorders epilepsy is the one that offers a unique opportunity to understand normal brain functions as derived from excessive dysfunction of neuronal circuits because the symptoms of epileptic seizures are not the result of usual loss of function that accompanies many disease that affect the brain I am therefore extremely honoured to present this book The 15 very interesting chapters of the book cover various fields in epileptology they encompass the etiology and pathogenesis of the disease clinical presentation with special attention to the epileptic syndromes of childhood principles of medical management surgical approaches as well as social aspects of the disease **Handbook of Pediatric Epilepsy Case Studies, Second Edition** Maria Augusta Montenegro, Jong M. Rho, 2023-06-01 Research in the field of epilepsy will continue at a rapid pace with the ultimate hope of curing many intractable epilepsy syndromes Fully updated this new edition is organized chronologically from neonate through adolescence and the handbook is the culmination of a group effort involving leading physicians and researchers whose contributions constitute a concise and practical reference for health professionals in training Here the contributors review the recent flood of new information on the pathophysiology genetics and treatment of the various epilepsy syndromes and the volume is distilled into an easy to use guide Fully updated text reviewing the latest research on the pathophysiology genetics and treatment of the various epilepsy syndromes Thorough descriptions of the different syndromes commonly encountered in clinical practice across the pediatric range Extensive resource section provided Contributors describe why they chose each particular case what they learned and how it changed their practice The book includes the most recent classification and nomenclature published by the International League Against Epilepsy

Childhood Epilepsy William B. Svoboda, 2004-03-04 More than half the numbers of children with epilepsy have interrelated language learning and or behavior complications By adulthood these problems can interfere with socialization and employment The seizures may be controlled but the developmental distortions can continue to present problems for health and education systems and carers In this comprehensive and fully referenced book William Svoboda distils a lifetime of clinical experience with childhood epilepsy into three areas which address each of the main areas of difficulty In each he looks at why the problems arise and assesses diagnostic and remedial approaches The focus is on the whole care of the child rather than on diagnosis classification and medication alone Clinicians mental health practitioners educators and speech language pathologists will find this book invaluable

Pediatric Neurology Part I Georg Dorfmueller, Olivier Delalande, 2013-04-24 Whereas there is no specific neurosurgical technique in pediatric epilepsy the frequency of each type of surgery is very different from epilepsy surgery applied in adults and reflects the underlying etiologies which are much more diverse in children with malformations

of cortical development and tumors as the prevailing etiologies Extensive resective or disconnective procedures for extratemporal epilepsy are more frequently performed in infants and younger children whereas temporo mesial resection is by far the most common surgical treatment for adults with epilepsy More recently less invasive techniques in children with an extensive epileptogenic zone such as multilobar disconnection hemispherotomy and other functional hemispherectomy variants have been introduced in order to reduce duration of surgery perioperative morbidity and length of hospital stay Likewise minimally invasive techniques are utilized such as the endoscopic disconnection of hypothalamic hamartomas for gelastic epilepsy This development has been encouraged with the introduction of image guided navigation systems for the preoperative planning and during surgery Historically epilepsy surgery for children has been established much later than for adults Apart from the particular aspects in perioperative management of younger infants surgery related morbidity as well as seizure outcome is in general similar to those in adults depending rather on each type of surgery
