Pediatric Heart Disease A Clinical Guide:

Pediatric Heart Disease Piers Daubeney, Michael Rigby, Michael Gatzoulis, Koichiro Niwa, 2012-08-08 A companion book to *Adult Congenital Heart Disease* that will concentrate on the practical management of children with heart conditions. This is aimed at general paediatricians and physicians who are responsible for ongoing management rather than specialists concerned with acute or rare presentations. The book will be illustrated with relevant radiology scans demonstrating which investigations are appropriate and will provide the relevant information for the generalist on patient management for different lesions. A section on emergency management is also included. Authorship is international with contributions from both sides of the Atlantic and from Japan. *Clinical Guide to Heart Transplantation* Jon Kobashigawa, 2025-10-02 This extensively revised textbook is a concise reference for those involved in the management of heart transplant. While this compilation of best practices cannot address the complexity of the individual patients we care for on a daily basis it will serve to help us ask the right questions, access the best evidence and ultimately make the best decisions for the patients involved. *Clinical Guide to Heart Transplantation* provides a current review of the field of heart transplantation and how it has evolved into an established therapy for the treatment of end stage heart failure. With the advent of improved surgical techniques, the development of immunosuppressive drugs and the utilization of more sophisticated monitoring strategies and treatments for graft rejection, heart transplantation now offers patients an avenue to both improved survival and quality of life. With over 4000 heart transplants performed per year globally and with 1 year survival approaching 90% this practical title is a vital reference to those involved in the this most complex of procedures to establish best practice. It is therefore essential reading for all practitioners in this field who are charged with making critical decisions in the management of patients donor organs and the transplant process itself to achieve the greatest benefit in the utilization of this often scarce resource. **A**
