## **Particle Image Velocimetry Cambridge Aerospace Series:**

*Particle Image Velocimetry* Ronald J. Adrian, Jerry Westerweel, 2011 Particle image velocimetry or PIV refers to a class of methods used in experimental fluid mechanics to determine instantaneous fields of the vector velocity by measuring the displacements of numerous fine particles that accurately follow the motion of the fluid Although the concept of measuring particle displacements is simple in essence the factors that need to be addressed to design and implement PIV systems that achieve reliable accurate and fast measurements and to interpret the results are surprisingly numerous The aim of this book is to analyze and explain them comprehensively

*Particle Image Velocimetry* Markus Raffel, Christian E. Willert, Fulvio Scarano, Christian J. Kähler, Steve T. Wereley, Jürgen Kompenhans, 2018-04-03 This immensely practical guide to PIV provides a condensed yet exhaustive guide to most of the information needed for experiments employing the technique This second edition has updated chapters on the principles and extra information on microscopic high speed and three component measurements as well as a description of advanced evaluation techniques What's more the huge increase in the range of possible applications has been taken into account as the chapter describing these applications of the PIV technique has been expanded

*Collective Dynamics of Particles* Cristian Marchioli, 2017-02-21 The book surveys the state of the art methods that are currently available to model and simulate the presence of rigid particles in a fluid flow For particles that are very small relative to the characteristic flow scales and move without interaction with other particles effective equations of motion for particle tracking are formulated and applied e.g. in gas solid flows For larger particles for particles in liquid solid flows and for particles that interact with each other or possibly modify the overall flow detailed model are presented Special attention is given to the description of the approximate force coupling method FCM as a more general treatment for small particles and derivations in the context of low Reynolds numbers for the particle motion as well as application at finite Reynolds numbers are provided Other topics discussed in the book are the relation to higher resolution immersed boundary methods possible extensions to non spherical particles and examples of applications of such methods to dispersed multiphase flows

**New Results in Numerical and Experimental Fluid Mechanics IX** Andreas Dillmann, Gerd Heller, Ewald Krämer, Hans-Peter Kreplin, Wolfgang Nitsche, Ulrich Rist, 2014-01-25 This book presents contributions to the 18th biannual symposium of the German Aerospace Aerodynamics Association STAB The individual chapters reflect ongoing research conducted by the STAB members in the field of numerical and experimental fluid mechanics and aerodynamics mainly for but not limited to aerospace applications and cover both nationally and EC funded projects By addressing a number of essential research subjects together with their related physical and mathematics fundamentals the book provides readers with a comprehensive overview of the current research work in the field as well as its main challenges and new directions Current work on e.g. high aspect ratio and low aspect ratio wings bluff bodies laminar flow control and transition active flow control hypersonic flows aeroelasticity aeroacoustics and biofluid mechanics is exhaustively discussed here

Numerical Study of Unsteady Low-reynolds Number Wing Performance Ashok Gopalathnam, Gregory Z. McGowan, 2008 Unsteady motions of airfoils at low Reynolds numbers were studied computationally using low order vortex lattice methods and using two high order methods a Reynolds Averaged Navier Stokes code and an Immersed Boundary method Results from the low order methods compared well with experimental and computational results in the literature for small reduced amplitudes and frequencies The high order methods were compared with experiments on high intensity pitch and plunging motions at Reynolds numbers of 10 000 and 40 000 The pitch rotation about the quarter chord and plunge motions were at reduced frequencies of 3 93 and with kinematically equivalent amplitudes of effective angle of attack at the quarter chord location For the plunge cases agreement between computation and experiment was qualitatively excellent and quantitatively acceptable but for the pitch cases the wake structure in the experiment was markedly different from that predicted by both computations which were however similar among one another In all cases Reynolds number effects were found to be negligible On going research aims to determine the parameters necessary for pitch plunge equivalence and also resolve the poor experiment computation agreement for pitch

Transport Processes at Taylor Bubbles in Vertical Channels Sven Kastens, 2021-04-19 Gas liquid contact apparatuses are widely used in chemical biochemical or pharmaceutical industry to provide and transfer gas species as reactant from the gaseous phase to pre dissolved reactants in the liquid phase enabling a preferred reaction The global and local transport are complex interlinked processes and therefore in practice in reactor design industry mostly empirically correlated For a secure control of the overall process and a more efficient reactor design the local transport processes at gas

liquid interfaces need to be investigated in complexity reduced systems to be understood Elongated bubbles Taylor bubbles in vertical channels 5.5 D 8 mm overcome the problem of dynamic shape deformation complex 3D rise trajectories and they have a volume independent rise velocity which make them the ideal experiment for reliable and reproducible investigations Detailed optical measurements of global and local processes via high speed Shadowgraphy 2D/2C PIV and p 2D LIF give new insights into the dependency of local bubble shape and global terminal rise velocity establish a Sherwood correlation of shrinking CO<sub>2</sub> bubbles in various channel sizes and shows the coupling of local transport phenomena at the bubble interface and the mixing in the wake region
