Monte Carlo Simulation And Resampling Methods For Social Science:

Monte Carlo Simulation and Resampling Thomas M. Carsey, Jeffrey J. Harden, 2014 Taking the topics of a quantitative methodology course and illustrating them through Monte Carlo simulation this book examines abstract principles such as bias efficiency and measures of uncertainty in an intuitive visual way Instead of thinking in the abstract about what would happen to a particular estimator in repeated samples the book uses simulation to actually create those repeated samples and summarise the results

Dependent Data in Social Sciences Research Mark Stemmler, Wolfgang Wiedermann, Francis L. Huang, 2024-10-21 This book covers the following subjects growth curve modeling directional dependence dyadic data modeling item response modeling IRT and other methods for the analysis of dependent data e g approaches for modeling cross section dependence multidimensional scaling techniques and mixed models It presents contributions on handling data in which the postulate of independence in the data matrix is violated When this postulate is violated and when the methods assuming independence are still applied the estimated parameters are likely to be biased and statistical decisions are very likely to be incorrect Problems associated with dependence in data have been known for a long time and led to the development of tailored methods for the analysis of dependent data in various areas of statistical analysis These include for example methods for the analysis of longitudinal data corrections for dependency and corrections for degrees of freedom Researchers and graduate students in the social and behavioral sciences education econometrics and medicine will find this up to date overview of modern statistical approaches for dealing with problems related to dependent data particularly useful

Illustrating Statistical Procedures: Finding Meaning in Quantitative Data Ray W. Cooksey, 2020-05-14 This book occupies a unique position in the field of statistical analysis in the behavioural and social sciences in that it targets learners who would benefit from learning more conceptually and less computationally about statistical procedures and the software packages that can be used to implement them This book provides a comprehensive overview of this important research skill domain with an emphasis on visual support for learning and better understanding The primary focus is on fundamental concepts procedures and interpretations of statistical analyses within a single broad illustrative research context The book covers a wide range of descriptive correlational and inferential statistical procedures as well as more advanced procedures not typically covered in introductory and intermediate statistical texts It is an ideal reference for postgraduate students as well as for researchers seeking to broaden their conceptual exposure to what is possible in statistical analysis

Monte Carlo Simulation Christopher Z. Mooney, 1997-04-07 Monte Carlo Simulation is a method of evaluating substantive hypotheses and statistical estimators by developing a computer algorithm to simulate a population drawing multiple samples from this pseudo population and evaluating estimates obtained from these samples Christopher Z Mooney explains the logic behind Monte Carlo Simulation and demonstrates its uses for social and behavioral research in conducting inference using statistics with only weak mathematical theory testing null hypotheses under a variety of plausible conditions assessing the robustness of parametric inference to violations of its assumptions assessing the quality of inferential methods and comparing the properties of two or more estimators In addition Mooney carefully demonstrates how to prepare computer algorithms using GAUSS code and illustrates these principles using several research examples is a method of evaluating substantive hypotheses and statistical estimators by developing a computer algorithm to simulate a population drawing multiple samples from this pseudo population and evaluating estimates obtained from these samples Christopher Z Mooney explains the logic behind and demonstrates its uses for social and behavioral research in conducting inference using statistics with only weak mathematical theory testing null hypotheses under a variety of plausible conditions assessing the robustness of parametric inference to violations of its assumptions assessing the quality of inferential methods and comparing the properties of two or more estimators In addition Mooney carefully demonstrates how to prepare computer algorithms using GAUSS code and
