Campbell, 2005-08-15 How does the brain represent number and make mathematical calculations What underlies the development of numerical and mathematical abilities What factors affect the learning of numerical concepts and skills What are the biological bases of number knowledge Do humans and other animals share similar numerical representations and processes What underlies numerical and mathematical disabilities and disorders and what is the prognosis for rehabilitation These questions are the domain of mathematical cognition the field of research concerned with the cognitive and neurological processes that underlie numerical and mathematical abilities The Handbook of Mathematical Cognition is a collection of 27 essays by leading researchers that provides a comprehensive review of this important research field **Image Schema Theory and Mathematical Cognition** Marcel Danesi, 2025-04-10 This book uses blending theory in math cognition and assesses the main aspect of this theory called image schema theory Applied work in math pedagogy has used this theory but no work has assessed its validity This book provides an overall assessment of the theory with regard to its validity in the study of math cognition Overall this book presents image schema theory as it has evolved today to mathematicians cognitive scientists and math educators deriving from it any concrete implications for modeling math in computer science and on the other side for making math pedagogy more effective Mathematical Cognition Brian Butterworth, Lisa Cipolotti, 1996 This volume is a collection of all papers published in Volume One of the journal Mathematical Cognition The aim of the journal is to provide a forum for explorations of how we understand mathematics and how we acquire and use mathematical concepts The journal encourages an interdisciplinary approach to the field and publishes advances in the study of the mental representation and use of mathematical concepts from a range of disciplines This first volume features contributions from cognitive psychology developmental psychology philosophy neuroscience education computational modelling and neuropsychology **Essays on mathematical reasoning : cognitive aspects of mathematical research and education** Jerzy Pogonowski, 2020-01-01

This volume contains four essays which may attract the attention of those readers who are interested in mathematical cognition. The main issues and questions addressed include: How do we achieve understanding of mathematical notions and ideas? What benefits can be obtained from the mistakes of great mathematicians? Which mathematical objects are standard and which are pathological? Is it possible to characterize the intended models of mathematical theories in a unique way?

Adventures of Mind and Mathematics Wolff-Michael Roth, 2020-08-24. This monograph uses the concept and category of event in the study of mathematics as it emerges from an interaction between levels of cognition from the bodily experiences to symbolism. It is subdivided into three parts. The first moves from a general characterization of the classical approach to mathematical cognition and mind toward laying the foundations for a view on the mathematical mind that differs from going approaches in placing primacy on events. The second articulates some common phenomena: mathematical thought, mathematical sign, mathematical form, mathematical reason and its development and affect in mathematics in new ways that are based on the previously developed ontology of events. The final part has more encompassing phenomena as its content: most prominently the thinking body of mathematics, the experience in and of mathematics and the relationship between experience and mind. The volume is well suited for anyone with a broad interest in educational theory and/or social development or with a broad background in psychology.

Handbook of Cognitive Mathematics Marcel Danesi, 2022-10-31. Cognitive mathematics provides insights into how mathematics works inside the brain and how it is interconnected with other faculties through so-called blending and other associative processes. This handbook is the first large collection of various aspects of cognitive mathematics to be amassed into a single title covering decades of connection between mathematics and other figurative processes as they manifest themselves in language, art, and even algorithms. It will be of use to anyone working in math, cognition, and education, with each section of the handbook edited by an international leader in that field.

The Adolescent Brain Valerie F. Reyna, 2012. The contributors reveal new findings about the basic mechanisms underlying brain development with particular reference to mathematical reasoning as well as to decision making in a variety of situations.

Math and Money Steven R. Guberman, 1992. **What Counts** Brian Butterworth, 1999. Though he admits to not being particularly good at math, Butterworth, cognitive neuropsychology U. College London, the founder of the *Mathematical Cognition* journal, contends that we all possess an inherent numerosity sense developed to different degrees of course. The author bases his case on empirical research and historical speculation. Annotation copyrighted by Book News, Inc., Portland, OR.

Interdisciplinary Perspectives on Math Cognition Marcel Danesi, 2019. This is an anthology of contemporary studies from various disciplinary perspectives written by some of the world's most renowned experts in each of the areas of mathematics, neuroscience, psychology, linguistics, semiotics, education, and more. Its purpose is not to add merely to the accumulation of studies but to show that math cognition is best approached from various disciplinary angles with the goal of broadening the

general understanding of mathematical cognition through the different theoretical threads that can be woven into an overall understanding This volume will be of interest to mathematicians cognitive scientists educators of mathematics philosophers of mathematics semioticians psychologists linguists anthropologists and all other kinds of scholars who are interested in the nature origin and development of mathematical cognition For the Learning of Mathematics ,1998 **The Innate Mind** Peter Carruthers,Stephen Laurence,Stephen P. Stich,2005 This is the third volume of a three volume set on The Innate Mind The extent to which cognitive structures processes and contents are innate is one of the central questions concerning the nature of the mind with important implications for debates throughout the human sciences By bringing together the top nativist scholars in philosophy psychology and allied disciplines these volumes provide a comprehensive assessment of nativist thought and a definitive reference point for future nativist inquiry The Innate Mind Volume 3 Foundations and the Future concerns a variety of foundational issues as well as questions about the direction of future nativist research It addresses such questions as What is innateness Is it a confused notion What is at stake in debates between nativists and empiricists What is the relationship between genes and innateness How do innate structures and learned information interact to produce adult forms of cognition e g about number and how does such learning take place What innate abilities underlie the creative aspect of language use and of creative cognition generally What are the innate foundations of human motivation and of human moral cognition In the course of their discussions many of the contributors pose the question whether explicitly or implicitly Where next for nativist research Together these three volumes provide the most intensive and richly cross disciplinary investigation of nativism ever undertaken They point the way toward a synthesis of nativist work that promises to provide a powerful picture of our minds and their place in the natural order Guide to Reprints Albert James Diaz,2008 **The Cumulative Book Index** ,1986 A world list of books in the English language *Abstract Mathematical Cognition* Wolfgang Grodd,Philippe Chassy,2016-08-09 Despite the importance of mathematics in our educational systems little is known about how abstract mathematical thinking emerges Under the uniting thread of mathematical development we hope to connect researchers from various backgrounds to provide an integrated view of abstract mathematical cognition Much progress has been made in the last 20 years on how numeracy is acquired Experimental psychology has brought to light the fact that numerical cognition stems from spatial cognition The findings from neuroimaging and single cell recording experiments converge to show that numerical representations take place in the intraparietal sulcus Further research has demonstrated that supplementary neural networks might be recruited to carry out subtasks for example the retrieval of arithmetic facts is done by the angular gyrus Now that the neural networks in charge of basic mathematical cognition are identified we can move onto the stage where we seek to understand how these basics skills are used to support the acquisition and use of abstract mathematical concepts **Mathematical Reviews** ,2007 Interdisciplinary Journal for Germanic Linguistics and Semiotic Analysis ,1999
