

The background of the cover features a 3D visualization of a mineral resource estimation model. It shows a blue, stepped, blocky surface representing a geological structure. A cluster of colorful, multi-colored dots (red, yellow, green, blue) is concentrated in the center of the structure, indicating a specific mineral resource. The overall background is a solid orange color.

## **Mineral Resource Estimation:**

**Mineral Resource Estimation** Mario E. Rossi, Clayton V. Deutsch, 2013-12-21 Mineral resource estimation has changed considerably in the past 25 years geostatistical techniques have become commonplace and continue to evolve computational horsepower has revolutionized all facets of numerical modeling mining and processing operations are often larger and uncertainty quantification is becoming standard practice Recent books focus on historical methods or details of geostatistical theory So there is a growing need to collect and synthesize the practice of modern mineral resource estimation into a book for undergraduate students beginning graduate students and young geologists and engineers It is especially fruitful that this book is written by authors with years of relevant experience performing mineral resource estimation and with years of relevant teaching experience This comprehensive textbook and reference fills this need

**Mineral Resource Estimation** B. L. Chatterji, 2016 The process of estimating a Mineral Resource can only take place after the estimator is convinced of the soundness of the fundamentals underlying the estimation process Thus the database of sampling density and other quality data for both estimation and geological interpretation must have integrity and robustness the geological data must be sufficiently complete for the definition of a geological model the geological model itself must have internal consistency should explain the observed arrangement of lithological and mineralogical domains and should represent the estimator's best knowledge of the genesis of the mineral deposit and the geological model should support the distribution of mineralisation seen in the sampling It is only at this stage that a resource model may be generated

**Evaluation of Uncertainties and Risks in Geology** György Bardossy, János Fodor, 2004-01-22 It is a well known fact that geological investigations are characterized by particularly high uncertainties Furthermore decisions related to geology such as mineral exploration mining investments etc are connected with higher risks than similar decisions in the branches of industry and economy Finally there are a number of highly dangerous natural hazards e g earthquakes volcanic activities inundations etc that are directly depending on geological processes It is of paramount interest to study them to describe them to understand their origin and if possible to predict them Uncertainties geological risks and natural hazards are often mentioned in geological text books conference proceedings and articles but no
