Ontology Engineering in a Networked World Mari Carmen Suárez-Figueroa, Asunción Gómez-Pérez, Enrico Motta, Aldo Gangemi, 2012-03-23 The Semantic Web is characterized by the existence of a very large number of distributed semantic resources which together define a network of ontologies These ontologies in turn are interlinked through a variety of different meta relationships such as versioning inclusion and many more This scenario is radically different from the relatively narrow contexts in which ontologies have been traditionally developed and applied and thus calls for new methods and tools to effectively support the development of novel network oriented semantic applications This book by Suárez-Figueroa et al provides the necessary methodological and technological support for the development and use of ontology networks which ontology developers need in this distributed environment After an introduction in its second part the authors describe the NeOn Methodology framework The book's third part details the key activities relevant to the ontology engineering life cycle For each activity a general introduction methodological guidelines and practical examples are provided The fourth part then presents a detailed overview of the NeOn Toolkit and its plug ins Lastly case studies from the pharmaceutical and the fishery domain round out the work The book primarily addresses two main audiences students and their lecturers who need a textbook for advanced undergraduate or graduate courses on ontology engineering and practitioners who need to develop ontologies in particular or Semantic Web based applications in general Its educational value is maximized by its structured approach to explaining guidelines and combining them with case studies and numerous examples The description of the open source NeOn Toolkit provides an additional asset as it allows readers to easily evaluate and apply the ideas presented

Ontological Engineering Approach of Developing Ontology of Information Science Ahlam F. Sawsaa,2015-08 Ontology has been a subject of many studies carried out in artificial intelligence AI and information system communities Ontology has become an important component of the semantic web covering a variety of knowledge domains Although building domain ontologies still remains a big challenge with regard to its designing and implementation there are still many areas that need to create ontologies Information Science IS is one of these areas that need a unified ontology model to facilitate information access among the heterogeneous data resources and share a common understanding of the domain knowledge Recently the development of domain ontologies has become increasingly important for knowledge level interoperation and information integration They provide functional features for AI and knowledge representation Domain Ontology is a central foundation of growth for the semantic web that provides a general knowledge for correspondence and communication among heterogeneous systems Particularly with a rise of ontology in the artificial intelligence AI domain it

can be seen as an almost inevitable development in computer science and AI in general
