**HARNESSING NVIDIA GPUS POTENTIAL BRIAN. PITMAN,2025** **GPU gems** Randima Fernando,2006 Using GPU-based Computing to Accelerate Finite Element Problems Jacob Watt,2012 Historically Graphics Processing Units GPU have been used for offloading graphical visualization and made popular in use for video games but with the development of NVIDIA's CUDA architecture and programming language there has been an increase in the use of GPUs in general purpose GPGPU programming Problems involving large systems of linear equations such as the Finite Element Analysis FEA can benefit greatly from the parallel computing

capabilities of GPUs In my thesis I will solve Poisson's equation and discuss the advantages and disadvantages of the massively parallel environment of GPUs I will show that on a unstructured grid that the matrix vector multiplication can be run 15-4 times faster on the GPU when compared to an Intel i5 CPU For all cases 2-D triangular elements with linear basis functions were used When the linear algebra problem is solved using the biconjugate gradient stabilized method BiCGSTAB the method runs 14-4 faster on the GPU as compared to the serial C code And lastly solving the whole FEA including data setup element integration assembly and memory transfer times performs 11-8 faster on the NVIDIA GPU compared to the serial code run on an Intel i5 CPU

#### Performance/accuracy Trade-offs of Floating-point Arithmetic on NVidia GPUs

Sruthikesh Surineni, 2017 Floating point computations produce approximate results possibly leading to inaccuracy and reproducibility problems Existing work addresses two issues first the design of high precision floating point representations and second the study of methods to support a trade off between accuracy and performance of central processing unit CPU applications However a comprehensive study of trade offs between accuracy and performance on modern graphic processing units GPUs is missing This thesis covers the use of different floating point precisions i.e single and double floating point precision in the IEEE 754 standard the GNU Multiple Precision Arithmetic Library GMP and composite floating point precision on a GPU using a variety of synthetic and real world benchmark applications First we analyze the support for a single and double precision floating point arithmetic on the considered GPU architectures and we characterize the latencies of all floating point instructions on GPU Second a study is presented on the performance accuracy tradeoffs related to the use of different arithmetic precisions on addition multiplication division and natural exponential function Third an analysis is given on the combined use of different arithmetic operations on three benchmark applications characterized by different instruction mixes and arithmetic intensities As a result of this analysis a novel auto tuner was designed in order to select the arithmetic precision of a GPU program leading to a better performance and accuracy tradeoff depending on the arithmetic operations and math functions used in the program and the degree of multithreading of the code
