Protocols for High Speed Networks IV G. Neufeld, M. Ito, 2013-11-11 Welcome to the fourth IFIP workshop on protocols for high speed networks in Vancouver This workshop follows three very successful workshops held in Zurich 1989 Palo Alto 1990 and Stockholm 1993 respectively We received a large number of papers in response to our call for contributions This year forty papers were received of which sixteen were presented as full papers and four were presented as poster papers Although we received many excellent papers the program committee decided to keep the number of full presentations low in order to accommodate more discussion in keeping with the format of a workshop Many people have contributed to the success of this workshop including the members of the program committee who with the additional reviewers helped make the selection of the papers We are thankful to all the authors of the papers that were submitted We also thank several organizations which have contributed financially to this workshop specially NSERC ASI CICS R UBC MPR Teltech and Newbridge Networks

**Parallel Programming Using C++** Gregory V. Wilson, Paul Lu, 1996-07-08 Foreword by Bjarne Stroustrup Software is generally acknowledged to be the single greatest obstacle preventing mainstream adoption of massively parallel computing While sequential applications are routinely ported

to platforms ranging from PCs to mainframes most parallel programs only ever run on one type of machine One reason for this is that most parallel programming systems have failed to insulate their users from the architectures of the machines on which they have run Those that have been platform independent have usually also had poor performance Many researchers now believe that object oriented languages may offer a solution By hiding the architecture specific constructs required for high performance inside platform independent abstractions parallel object oriented programming systems may be able to combine the speed of massively parallel computing with the comfort of sequential programming Parallel Programming Using C describes fifteen parallel programming systems based on C the most popular object oriented language of today These systems cover the whole spectrum of parallel programming paradigms from data parallelism through dataflow and distributed shared memory to message passing control parallelism For the parallel programming community a common parallel application is discussed in each chapter as part of the description of the system itself By comparing the implementations of the polygon overlay problem in each system the reader can get a better sense of their expressiveness and functionality for a common problem For the systems community the chapters contain a discussion of the implementation of the various compilers and runtime systems In addition to discussing the performance of polygon overlay several of the contributors also discuss the performance of other more substantial applications For the research community the contributors discuss the motivations for and philosophy of their systems As well many of the chapters include critiques that complete the research arc by pointing out possible future research directions Finally for the object oriented community there are many examples of how encapsulation inheritance and polymorphism can be used to control the complexity of developing debugging and tuning parallel software
