## Assumptions

### **M/M/1**

- ▶ The arriving time follows a Poisson Process with parameter  $\lambda$ .
- ▶ The time taken to complete a single service is independent and exponentially distributed with parameter  $\mu$ .
- ▶ Single server system
- ▶ The queuing discipline is general (FCFS)
- ▶ The number of customers in the system is very large.

### **M/D/1**

- ▶ The assumptions taken with respect to arriving time, server system and queuing discipline are the same as M/M/1 model. But the service time is deterministic.

**Wide Area Network Design** Robert Cahn, 1998-05 As the cost of building and upgrading complex large scale networks skyrockets carefully crafted network designs become critical a savings of as little as 5% in your network can amount to tens of thousands of dollars per month Wide Area Network Design Concepts and Tools for Optimization provides the information you need to tackle the challenges of designing a network that meets your performance goals within the cost constraints of your organization If you are considering public service alternatives such as frame relay designing your own network with the tools provided in this book will empower you to estimate cost savings and evaluate bids from competing carriers Intended for network designers planners and architects this book enables you to estimate traffic flows and requirements in your network and explains how to use various algorithms to design a network which must meet these requirements Features Presents underlying design principles to help you understand emerging and future networking protocols and technologies Provides cost and traffic generators for estimating these parameters in your network Introduces the unique IncreMEnTOR algorithm which can help avert disaster when the traffic flows in your network have changed

**Introduction to Stochastic Level Crossing Techniques** Percy H. Brill, 2023-09-29 Introduction to Stochastic Level Crossing Techniques describes stochastic models and their analysis using the System Point Level Crossing method abbreviated SPLC or LC This involves deriving probability density functions pdfs or cumulative probability distribution functions cdfs of key random variables applying simple level crossing limit theorems developed by the author The pdfs and or cdfs are used to specify operational characteristics about the stochastic model of interest The chapters describe distinct stochastic models and associated key random variables in the models For each model a figure of a typical sample path realization i e tracing over time of the key random variable is displayed For each model an analytic Volterra integral equation for the stationary pdf of the key random variable is created by inspection of the sample path using the simple LC limit theorems This LC method bypasses a great deal of algebra usually required by other methods of analysis The integral equations will be solved directly or computationally This book is meant for students of mathematics management science engineering natural sciences and researchers who use applied probability It will also be useful to technical workers in a range of professions Key Features A description of one representative stochastic model e g a single server M/G/1 queue a multiple server M/M/c queue an inventory system etc Construction of a typical sample path of the key random variable of interest e g the virtual waiting time or workload in queues the net on hand inventory in inventory systems etc Statements of the simple LC theorems which connect the sample path upcrossing and downcrossing rates across state space levels to simple mathematical functions of the stationary pdf of the key random variable at those state space levels Creation of usually Volterra integral equations for the stationary pdf of the key random variable by inspection of the sample path Direct analytic solution of the integral equations where feasible or computational solutions of the integral equations Use of the derived stationary pdfs for obtaining operational characteristics

**An Introduction to Queueing Systems** Sanjay K. Bose, 2013-12-01 Queueing is an aspect of modern life that we encounter at every step in our daily activities Whether it happens at the checkout counter in the supermarket or in accessing the Internet the basic phenomenon of queueing arises whenever a shared facility needs to be accessed for service by a large number of jobs or customers The study of queueing is important as it provides both a theoretical background to the kind of service that we may expect from such a facility and the way in which the facility itself may be designed to provide some specified grade of service to its customers Our study of queueing was basically motivated by its use in the study of communication systems and computer networks The various computers routers and switches in such a network may be modelled as individual queues The whole system may itself be modelled as a queueing network providing the required service to the messages packets or cells that need to be carried Application of queueing theory provides the theoretical framework for the design and study of such networks The purpose of this book is to support a course on queueing systems at the senior undergraduate or graduate levels Such a course would then provide the theoretical background on which a subsequent course on the performance modeling and analysis of computer networks may be based
