## Student Exploration: Microevolution

**Vocabulary:** allele, cystic fibrosis, deleterious, dominant allele, fitness, genotype, heterozygote, superiority, heterozygous, homozygous, incompletely dominant, malaria, predator, recessive allele, sickle cell anemia

**Prior Knowledge Questions** (Do these BEFORE using the Gizmo.)

Many people from warm regions carry an **allele** that provides resistance to **malaria**. Two copies of this allele, however, causes a deadly blood disorder called **sickle cell anemia**.

1. Suppose two parents are healthy carriers of the sickle-cell allele. The **genotype** of each parent is  $AS$  ( $A$  is the normal allele, and  $S$  is the sickle-cell allele).

How likely is it for a child of these parents to have sickle cell anemia ( $SS$ )? **50%**

2. Do you think the allele for sickle cell anemia would be common in regions where malaria did not exist? Explain why or why not. **No, the allele for sickle cell anemia would not be common as the region would not be exposed to malaria, thus would not need a resistance towards it.**

### Gizmo Warm-up

If natural selection does not favor one trait over another, the frequencies of various alleles in a population will tend to be stable over long periods of time. But what happens when one allele confers an advantage or disadvantage to an individual? These scenarios and others can be explored with the *Microevolution* Gizmo.

1. The feather color of the parrots in the Gizmo is controlled by two alleles,  $D$  and  $d$ . The  $D$  allele is **incompletely dominant** over  $d$ . What is the feather color of each parrot genotype?

$DD$  **Dark green**

$Dd$  **Light green**

$dd$  **yellow**

2. The **fitness** of parrots is determined by how well they blend into the background trees. Set the **Fitness of  $DD$**  slider to 100% and the other fitness sliders to 60%.

The birds with which genotype blend into the background now?  **$DD$**

3. Click **Begin**, and then click **Predator**. Which parrots were killed by **predators**?  **$Dd$  and  $dd$**

Plant Microevolution and Conservation in Human-influenced Ecosystems David Briggs, 2009-11-26 As human activities are increasingly domesticating the Earth's ecosystems new selection pressures are acting to produce winners and losers amongst our wildlife With particular emphasis on plants Briggs examines the implications of human influences on micro evolutionary processes in different groups of organisms including wild weedy invasive feral and endangered species Using case studies from around the world he argues that Darwinian evolution is ongoing He considers how far it is possible to conserve endangered species and threatened ecosystems through management and questions the extent to which damaged landscapes and their plant and animal communities can be precisely recreated or restored Many of Darwin's ideas are highlighted including his insights into natural selection speciation the vulnerability of rare organisms the impact of invasive species and the effects of climate change on organisms An important text for students and researchers of evolution conservation climate change and sustainable use of resources

### **Debating Cancer: The Paradox In Cancer Research**

Henry H Q Heng, 2015-10-08 Cancer research is at a crossroads Traditionally cancer has been thought of as a disease of gene mutation where the stepwise accumulation of cancer gene mutations is the key and the identification of common gene mutations has been considered to be essential for diagnosis and treatment Despite extensive research efforts and accumulated knowledge on cancer genes and pathways the clinical benefits of this traditional approach have been limited Recently cancer genome sequencing has revealed an extensive amount of genetic heterogeneity where the long expected common mutation drivers have been difficult if not impossible to identify These realities ultimately challenge the conceptual framework of current cancer biology This book introduces a new concept of genome theory of cancer evolution in an attempt to unify the field Many important and representative but often confusing questions and paradoxes are critically analyzed By comparing gene and genome based theories the hidden flaws of many popular viewpoints are addressed This discussion is intended to initiate a much needed critical re evaluation of current cancer research
