ADVANCES IN DEEP LEARNING AND COMPUTER VISION Dr. Jagadeesh Kumar, 2024-12-18 Computer Vision CV can be defined as the hypothesis and innovation for building artificial frameworks that acquire data from pictures or multi dimensional information A more straightforward clarification is that computer vision endeavors to take care of similar issues you can unravel with your own one of kind eyes For instance in case you're driving and you see a kid run into the street your mind will rapidly translate the kid in the street in front of you that it's perilous and that you ought to quickly brake to abstain from hitting the kid That is one of the issues self driving vehicle engineers are presently striving to comprehend by the methods of computer vision The method requires being competent of realizing object recognition which can be subdivided into three varieties object classification identification and detection Object Classification is everywhere you have a little recently learned objects that you need to have the option to perceive in a picture Characterizing a representation photograph as having individual's face in it is a model object classification arranged that this photograph contains a face in it Object Identification is the recognition of a specific instance of an object For example being able to identify that there are two faces in an image and that one is John and the other is Sarah is an example of object identification Object Detection is the ability to identify that there's an object in an image This is typically used for things like automatic toll roads where you want to know when a new object has entered the frame so you can take a scan the license plate Connecting this to the self driving car problem if you think to how the human brain would solve this problem it would have to answer the same questions In order for the situation to be dangerous we would have to both identify that there is a child object in or approaching the road Identify that the child in the road is something that we should avoid You would also want to identify other objects like trash soccer ball bike etc where you don't necessarily need evasive action In other words Computer Vision is the field of study that seeks to develop techniques to help computers see and understand the content of digital images such as photographs and videos The problem of computer vision appears simple because it is trivially solved by people even very young children Nevertheless it largely remains an unsolved problem based both on the limited understanding of biological vision and because of the complexity of vision perception in a dynamic and nearly infinitely varying physical world *Mike Meyers'* *CompTIA A+ Guide to Managing and Troubleshooting PCs Lab Manual, Fourth Edition (Exams 220-801 & 220-802)* Michael

Storage Systems

Alexander Thomasian, 2021-10-13 *Storage Systems Organization, Performance, Coding, Reliability, and Their Data Processing* was motivated by the 1988 Redundant Array of Inexpensive Independent Disks proposal to replace large form factor mainframe disks with an array of commodity disks. Disk loads are balanced by striping data into strips with one strip per disk and storage reliability is enhanced via replication or erasure coding which at best dedicates k strips per stripe to tolerate k disk failures. Flash memories have resulted in a paradigm shift with Solid State Drives (SSDs) replacing Hard Disk Drives (HDDs) for high performance applications. RAID and Flash have resulted in the emergence of new storage companies namely EMC, NetApp, SanDisk, and Purestorage and a multibillion dollar storage market. Key new conferences and publications are reviewed in this book. The goal of the book is to expose students, researchers, and IT professionals to the more important developments in storage systems while covering the evolution of storage technologies, traditional and novel databases, and novel sources of data. We describe several prototypes: FAWN at CMU, RAMCloud at Stanford, and Lightstore at MIT. Oracle's Exadata, AWS Aurora, Alibaba's PolarDB, Fungible Data Center, and author's paper designs for cloud storage namely heterogeneous disk arrays and hierarchical RAID. Surveys storage technologies and lists sources of data measurements, text, audio, images, and video. Familiarizes with paradigms to improve performance, caching, prefetching, log structured file systems, and merge trees. Describes RAID organizations and analyzes their performance and reliability. Conserves storage via data compression, deduplication, compaction, and secures data via encryption. Specifies implications of storage technologies on performance and power consumption. Exemplifies database parallelism for big data, analytics, deep learning via multicore CPUs, GPUs, FPGAs, and ASICs, e.g., Google's Tensor Processing Units.
