Policy, Committee on Crisis Standards of Care: A Toolkit for Indicators and Triggers, 2013-10-27 Disasters and public health emergencies can stress health care systems to the breaking point and disrupt delivery of vital medical services. During such crises hospitals and long term care facilities may be without power, trained staff, ambulances, medical supplies and beds could be in short supply and alternate care facilities may need to be used. Planning for these situations is necessary to provide the best possible health care during a crisis and if needed equitably allocate scarce resources. Crisis Standards of Care: A Toolkit for Indicators and Triggers examines indicators and triggers that guide the implementation of crisis standards of care and provides a discussion toolkit to help stakeholders establish indicators and triggers for their own communities. Together, indicators and triggers help guide operational decision making about providing care during public health and medical emergencies and disasters. Indicators and triggers represent the information and actions taken at specific thresholds that guide incident recognition, response and recovery. This report discusses indicators and triggers for both a slow onset scenario such as pandemic influenza and a no notice scenario such as an earthquake. Crisis Standards of Care features discussion toolkits customized to help various stakeholders develop indicators and triggers for their own organizations, agencies and jurisdictions. The toolkit contains scenarios, key questions and examples of indicators, triggers and tactics to help promote discussion. In addition to common elements designed to facilitate integrated planning, the toolkit contains chapters specifically customized for emergency management, public health, emergency medical services, hospital and acute care and out-of-hospital care.

Disaster health is an emerging field that focuses on developing prevention, preparation, response and recovery systems for dealing with health problems that result from a disaster. As disasters worldwide differ in their nature, scope and cultural context, a thorough understanding of the fundamental tenets of sound disaster health management is essential for both students and practitioners to participate confidently and effectively in the field. *Disaster Health Management* is the first comprehensive textbook to provide a standard guide to terminology and management systems across the entire spectrum of disaster health. Authored by experienced educators, researchers and practitioners in disaster health management, this textbook provides an authoritative overview of the conceptual basis for disaster management systems and structures for disaster management. Managing disasters through the continuum of preparedness, response and recovery, the variations associated with both natural and technological disasters, the strategic considerations associated with leadership, research, education and future directions. Using Australasian systems and structures as examples of generic principles which will find application globally, *Disaster Health Management* is an essential text for both undergraduate and postgraduate students as well as for professionals involved in all aspects of disaster management.

### **Health and Medical Aspects of Disaster Preparedness**

**John C. Duffy, 2012-12-06** The study of Health and Medical Aspects of Disaster Preparedness was approved by NATO CCMS in 1985 with the first pilot study meeting in June of that year. The pilot study under the leadership of the United States and Belgium focused on the current status of disaster preparedness in participating nations. An objective look was taken at the availability of resources to cope with disasters from an international standpoint. The types of disaster settings that were reviewed in the study included the following: 1. Earthquakes, floods, hurricanes, avalanches; 2. Nuclear power plant accidents or spills; 3. Water and aircraft accidents; 4. Building fires, building collapses; 5. Contamination by hazardous chemicals or biological waste; 6. Civil disturbances. A disaster can strike anywhere at any time. Some nations and local communities have well-developed disaster plans with which to meet catastrophic situations. The fact is that most communities are without written and coordinated disaster plans which offer their citizens the most effective and comprehensive protection in these unexpected and often critical situations. Disaster has been defined as a sudden event which involves large numbers of people and results in loss of life, serious injury, and property loss together with a severe disruption of community organization and

services In the United States thousands of people are killed and injured in disasters every year Thus disasters constitute a serious problem in both individual and public health terms in this country alone Disasters can be classified as natural and man made *Emergency Medicine: Just the Facts, Second Edition* O.
