Membrane Biogenesis Mitochondria Chloroplasts And Bacteria:

Membrane Biogenesis Alexander Tzagoloff, 2012-12-06 There are currently a growing number of laboratories actively studying the mechanism by which various biological membranes are assembled This area of research is still relatively new to biochemists and molecular biologists but in view of the rapid progress being made a review of the field at this time is justified The present volume focuses on the biogenesis of three related membranes Mitochondria and chloroplasts are semiautonomous organelles whose biogenesis is carried out partly in the external cytoplasm and partly by the organelles themselves Both membranes are principally concerned with the energy metabolism of the cell and this commonality of function is reflected in a considerable degree of similarity in their ultrastructure and enzymatic composition Although the bacterial cell membrane is a much more diversified structure it also fulfills the basic energy requirements of the cell and depending on the organism this can take the form of photosynthesis or oxidative phosphorylation The additional consideration that prokaryotic organisms may in fact be the evolutionary ancestors of mitochondria and chloroplasts makes it all the more compelling that those interested in biogenesis be aware of new developments in each of these three areas In organizing this book I felt that the contributors should summarize and bring up to date their own research and review the literature only insofar as would be necessary to provide the proper perspective for their work *Membrane Biogenesis, Mitochondria, Chloroplasts, and Bacteria* Alexander Tzagoloff, 1975 **Membrane Biogenesis** Alexander Tzagoloff, 1975-07-01 Mitochondria, Chloroplasts, and Bacterial Membranes John N. Prebble, 1981 Mitochondria and chloroplasts basic concepts Development of ideas on oxidation and phosphorylation Mitochondrial oxidative metabolism The structure of the mitochondrion Mitochondrial biogenesis Mitochondrial water movement and substrate transport Mitochondrial cation transport Theories of phosphorylation Resolution of the respiratory chain and oxidative phosphorylation Bacterial energy transformation Photosynthesis the fixation of carbon dioxide The chloroplast structure properties and biogenesis Chloroplast photochemistry The chloroplast electron transport chain Bacterial photosynthesis Ultrastructure, Macromolecules, and Evolution Lawrence S. Dillon, 2013-11-11 Thus far in the history of biology two and only two fundamental principles have come to light that pervade and unify the entire science the cell theory and the concept of evolution While it is true that recently opened fields of investigation have given rise to several generalizations of wide impact such as the universality of DNA and the energetic dynamics of ecology closer inspection reveals them to be part and parcel of either of the first two mentioned Because in the final analysis energy can act upon an organism solely at the cellular level its effects may be perceived basically to represent one facet of cell metabolism Similarly because the DNA theory centers upon the means by which cells build proteins and reproduce themselves it too proves to be only one more even though an exciting aspect of the cell theory In fact if the matter is given closer scrutiny evolution itself can be viewed as being a fundamental portion of the cell concept for its effects arise only as a consequence of changes in the cell's genetic

apparatus accumulating over geological time Or if one wishes the diametrically opposite standpoint may be taken For if current concepts of the origin of life hold any validity the evolution of precellular organisms from the primordial biochemicals must have proceeded over many eons of time prior to the advent of even the most primitive cell

undergone a number of metamorphoses in its relatively brief existence It has been in approximate succession morphology epidemiology biochemistry genetics and molecular biology It is also becoming a significant parcel of cell surface studies The one embodiment which has remained elusive particularly for bacteriology is the taxonomic one This may have been a blessing in disguise because it encouraged microbiologists to deal with the general rather than the particular promoting a search for unitary explanations in the manner of Kluver and van Niel long before anyone knew about the universality of the genetic code or could trace the genealogy of enzymes from the study of amino acid substitutions This volume is predicated on the idea that deep analogies underly the mechanisms of cellular interaction and therefore belongs in the unitary tradition of microbiology It occupies itself with a wide variety of micro organisms considering them from vantage points of considerable diversity ranging from taxonomic irreverence to keen evolutionary awareness and is concerned with areas which have developed independently of each other
