Loewner's Theorem on Monotone Matrix Functions Barry Simon, 2019-08-29 This book provides an in depth discussion of Loewner's theorem on the characterization of matrix monotone functions The author refers to the book as a love poem one that highlights a unique mix of algebra and analysis and touches on numerous methods and results The book details many different topics from analysis operator theory and algebra such as divided differences convexity positive definiteness integral representations of function classes Pick interpolation rational approximation orthogonal polynomials continued fractions and more Most applications of Loewner's theorem involve the easy half of the theorem A great number of interesting techniques in analysis are the bases for a proof of the hard half Centered on one theorem eleven proofs are discussed both for the study of their own approach to the proof and as a starting point for discussing a variety of tools in analysis Historical background and inclusion of pictures of some of the main figures who have developed the subject adds another depth of perspective The presentation is suitable for detailed study for quick review or reference to the various methods that are presented The book is also suitable for independent study The volume will be of interest to research mathematicians physicists and graduate students working in matrix theory and approximation as well as to analysts and mathematical physicists

Integral Fourier Operators Michèle Audin, Catherine Ducourtioux, Françoise Ouédraogo, René Schulz, Julio Delgado, Michael Ruzhansky, Gilles Lebeau, 2018-04-17 This volume of contributions based on lectures delivered at a school on Fourier Integral Operators held in Ouagadougou Burkina Faso 14-26 September 2015 provides an introduction to Fourier Integral Operators FIO for a readership of Master and PhD students as well as any interested layperson Considering the wide spectrum of their applications and the richness of the mathematical tools they involve FIOs lie the cross road of many a field This volume offers the necessary background whether analytic or geometric to get acquainted with FIOs complemented by more advanced material presenting various aspects of active research in that area

Mathematics of Optimization: How to do Things Faster Steven J. Miller, 2017-12-20 Optimization Theory is an active area of research with numerous applications many of the books are designed for engineering classes and thus have an emphasis on problems from such fields Covering much of the same material there is less emphasis on coding and detailed applications as the intended audience is more mathematical There are still several important problems discussed especially scheduling problems but there is more emphasis on theory and less on the nuts and bolts of coding A constant theme of the text is the why and the how in the subject Why are we able to do a calculation efficiently How should we look at a problem Extensive effort is made to motivate the mathematics and isolate how one can apply ideas perspectives to a variety of problems As many of the key algorithms in the subject require too much time or detail to analyze in a first course such as the run time of the Simplex Algorithm there are numerous comparisons to simpler algorithms which students have either seen or can quickly learn such as the Euclidean algorithm to motivate the type of results on run time savings

Convex Optimization Euclidean Distance

Geometry 2e Dattorro, 2015-09-29 Convex Analysis is an emerging calculus of inequalities while Convex Optimization is its application Analysis is the domain of the mathematician while Optimization belongs to the engineer In layman's terms the mathematical science of Optimization is a study of how to make good choices when confronted with conflicting requirements and demands The qualifier Convex means when an optimal solution is found then it is guaranteed to be a best solution there is no better choice As any convex optimization problem has geometric interpretation this book is about convex geometry with particular attention to distance geometry and nonconvex combinatorial and geometrical problems that can be relaxed or transformed into convexity A virtual flood of new applications follows by epiphany that many problems presumed nonconvex can be so transformed This is a BLACK WHITE paperback A hardcover with full color interior as originally conceived is available at lulu.com spotlight dattorro

Topology Tai-Danae Bradley, Tyler Bryson, John Terilla, 2020-08-18 A graduate level textbook that presents basic topology from the perspective of category theory This graduate level textbook on topology takes a unique approach it reintroduces basic point set topology from a more modern categorical perspective Many graduate students are familiar with the ideas of point set topology and they are ready to learn something new about them Teaching the subject using category theory a contemporary branch of mathematics that provides a way to represent abstract concepts both deepens students understanding of elementary topology and lays a solid foundation for future work in advanced topics After presenting the basics of both category theory and topology the book covers the universal properties of familiar constructions and three main topological properties connectedness Hausdorff and compactness It presents a fine grained approach to convergence of sequences and filters explores categorical limits and colimits with examples looks in detail at adjunctions in topology particularly in mapping spaces and examines additional adjunctions presenting ideas from homotopy theory the fundamental groupoid and the Seifert van Kampen theorem End of chapter exercises allow students to apply what they have learned The book expertly guides students of topology through the important transition from undergraduate student with a solid background in analysis or point set topology to graduate student preparing to work on contemporary problems in mathematics

Square Roots of Elliptic Systems in Locally Uniform Domains Sebastian Bechtel, 2024-09-09 This book establishes a comprehensive theory to treat square roots of elliptic systems incorporating mixed boundary conditions under minimal geometric assumptions To lay the groundwork the text begins by introducing the geometry of locally uniform domains and establishes theory for function spaces on locally uniform domains including interpolation theory and extension operators In these introductory parts fundamental knowledge on function spaces interpolation theory and geometric measure theory and fractional dimensions are recalled making the main content of the book easier to comprehend The centerpiece of the book is the solution to Kato's square root problem on locally uniform domains The Kato result is complemented by corresponding L_p bounds in natural intervals of integrability parameters This book will be useful to researchers in harmonic analysis functional analysis and related areas

Analytic Learning

Methods for Pattern Recognition Kar-Ann Toh, Huiping Zhuang, Simon Liu, Zhiping Lin, 2025-05-31 This textbook is a consolidation of learning methods which comes in an analytic form The covered learning methods include classical and advanced solutions to problems of regression minimum classification error maximum receiver operating characteristics bridge regression ensemble learning and network learning Both the primal and dual solution forms are discussed for over and under determined systems Such coverage provides an important perspective for handling systems with overwhelming samples or systems with overwhelming parameters For goal driven classification the solutions to minimum classification error maximum receiver operating characteristics bridge regression and ensemble learning represent recent advancements in the literature In this book the exercises offer instructors and students practical experience with real world applications

Even the simplest mathematical abstraction of the phenomena of reality the real line can be regarded from different points of view by different mathematical disciplines For example the algebraic approach to the study of the real line involves describing its properties as a set to whose elements we can apply operations and obtaining an algebraic model of it on the basis of these properties without regard for the topological properties On the other hand we can focus on the topology of the real line and construct a formal model of it by singling out its continuity as a basis for the model Analysis regards the line and the functions on it in the unity of the whole system of their algebraic and topological properties with the fundamental deductions about them obtained by using the interplay between the algebraic and topological structures The same picture is observed at higher stages of abstraction Algebra studies linear spaces groups rings modules and so on Topology studies structures of a different kind on arbitrary sets structures that give mathematical meaning to the concepts of a limit continuity a neighborhood and so on Functional analysis takes up topological linear spaces topological groups normed rings modules of representations of topological groups in topological linear spaces and so on Thus

the basic object of study in functional analysis consists of objects equipped with compatible algebraic and topological structures

TEXTBOOK OF FUNCTIONAL ANALYSIS V. K. KRISHNAN, 2014-01-01 This unique comprehensive and student friendly book now in its second edition continues to hold the purpose of explaining and illustrating the use of the basic theorems in functional analysis through solved numerical problems The text has been revised on the basis of the readers feedback The book now covers ample worked out numerical problems related to the spectral properties of compact operators on Banach spaces as well as on Hilbert spaces Inclusion of a few problems based on the square root of a positive operator also contributes to the major highlights of this edition Such a practical approach will greatly facilitate students to have a thorough grasp of the subject This stands in stark contrast to the method followed in most of the books where a great amount of theory is given with a smattering of problems to elucidate the topics discussed Intended as a text for the students pursuing postgraduate courses in mathematics this book with its systematic and precise presentation and provision of a large number of exercises should prove to be a trendsetter in its approach to the subject This novelty of approach appeals the students in particular
