Grid Resource Management Mumtaz Siddiqui, Thomas Fahringer, 2010-01-30 In a dynamic computing environment such as the Grid resource management plays a crucial role for making distributed resources available on demand to anyone from anywhere at any time without undermining the resource autonomy this becomes an art when dealing with heterogeneous resources distributed under multiple trust domains spanning across the Internet Today Grid execution environments provide abstract workflow descriptions that need a dynamic mapping to actual deployments this further accentuates the importance of resource management in the Grid This monograph renders boundaries of the Grid resource management identifies research challenges and proposes new solutions with innovative techniques for on demand provisioning automatic deployments dynamic synthesis negotiation based advance reservation and capacity planning of Grid resources The Grid capacity planning is performed with multi constrained optimized resource allocations by modelling resource allocation as an on line strip packing problem and introducing a new solution that optimizes resource utilization and QoS while generating contention free solutions On demand resource provisioning becomes possible by simplifying abstract resource descriptions independent from the concrete installations The book further explains the use of the semantic web technologies in the Grid to specify explicit definitions and unambiguous machine interpretable resource descriptions for intelligent resource matching and synthesis the synthesis process generates new compound resources with aggregated capabilities and prowess The newly introduced techniques haven been developed and integrated in ASKALON Grid application development and runtime environment deployed in the Austrian Grid and demonstrated through well performed experiments

Thermosciences Division, William C. Reynolds, 1987 The objective of the present work is to overcome the inadequacies of conventional skin friction measuring methods in terms of temporal and spatial resolution An instrument has been developed for measurement of the instantaneous velocity gradient in a boundary layer at a solid surface from which the instantaneous wall shear stress can be deduced The principle of the device is akin to that of dual beam Laser Doppler Anemometer Instead of crossing two laser beams to produce the measuring volume the present technique uses interference between two closely spaced cylindrical waves emanating from the solid surface The interference fringes which constitute the measuring volume appear to be radiating from a point on surface Keywords Skin friction Fluid flow Lasers Boundary layers Doppler method Wall shear stress Laser beams Cylindrical waves *Communications Regulation* ,2001 **Lighting Dimensions** ,2004-07
