Powers, 2011-05-25 Fundamentals of Nonlinear Optics encompasses a broad spectrum of nonlinear phenomena from second harmonic generation to soliton formation The wide use of nonlinear optical phenomena in laboratories and commercial devices requires familiarity with the underlying physics as well as practical device considerations This text adopts a combined approach to analyze the complimentary aspects of nonlinear optics enabling a fundamental understanding of both a given effect and practical device applications After a review chapter on linear phenomena important to nonlinear optics the book tackles nonlinear phenomena with a look at the technologically important processes of second harmonic generation sum frequency and difference frequency generation and the electro optic effect The author covers these processes in considerable detail at both theoretical and practical levels as the formalisms developed for these effects carry to subsequent topics such as four wave mixing self phase modulation Raman scattering Brillouin scattering and soliton formation Consistently connecting theory process effects and applications this introductory text encourages students to master key concepts and to solve nonlinear optics problems preparing them for more advanced study Along with extensive problems at the end of each chapter it presents general algorithms accessible to any scientific graphical and programming package Watch the author speak about the book Nonlinear Optics Nicolaas Bloembergen, 1996 Nicolaas Bloembergen recipient of the Nobel Prize for Physics 1981 wrote Nonlinear Optics in 1964 when the field of nonlinear optics was only three years old The available literature has since grown by at least three orders of magnitude The vitality of Nonlinear Optics is evident from the still growing number of scientists and engineers engaged in the study of new nonlinear phenomena and in the development of new nonlinear devices in the field of opto electronics This monograph should be helpful in providing a historical introduction and a general background of basic ideas both for experts specializing in this discipline and for scientists and students who wish to become acquainted with it This is the fourth reprint and includes new references to the recent literature Quantum Nonlinear Optics Eiichi Hanamura, Yutaka Kawabe, Akio Yamanaka, 2007-07-04 It was more than ten years ago that an original version of this monograph was published with the title Quantum Optics in Japanese from Iwanami Shoten in Tokyo Therefore making the best use of this chance to translate the book into an English version we have tried to include the exciting developments of the relevant subjects in these ten years especially novel nonlinear optical responses of materials The first example of these nonlinear optical phenomena is laser cooling and subsequent observation of Bose Einstein and Fermi condensation of neutral atoms Second it is now possible to generate femtosecond laser pulses Then higher harmonics in the extreme ultraviolet and soft

X ray regions and higher order Raman scattering can be generated by irradiating these ultrashort laser pulses on atomic and molecular gases and crystals These multistep signals are applied to the generation of attosecond laser pulses Third interference effects of the second harmonics are used to observe the ferroelectric and antiferromagnetic domain structures of crystals with a strongly correlated electronic system These novel nonlinear optical phenomena could not be treated without the quantized radiation field We already have classical textbooks treating individually the quantum theory of the radiation field and nonlinear optics Taking account of these situations we have described these exciting nonlinear optical responses as well as laser oscillation and superradiance based upon the quantum theory of the radiation field At the same time we have changed the title of this monograph to Quantum Nonlinear Optics
