Nonlinear Assignment Problems Algorithms And Applications Combinatorial Optimization:

Nonlinear Assignment Problems Panos M. Pardalos,L.S. Pitsoulis,2013-03-09 Nonlinear Assignment Problems NAPs are natural extensions of the classic Linear Assignment Problem and despite the efforts of many researchers over the past three decades they still remain some of the hardest combinatorial optimization problems to solve exactly The purpose of this book is to provide in a single volume major algorithmic aspects and applications of NAPs as contributed by leading international experts The chapters included in this book are concerned with major applications and the latest algorithmic solution approaches for NAPs Approximation algorithms polyhedral methods semidefinite programming approaches and heuristic procedures for NAPs are included while applications of this problem class in the areas of multiple target tracking in the context of military surveillance systems of experimental high energy physics and of parallel processing are presented Audience Researchers and graduate students in the areas of combinatorial optimization mathematical programming operations research physics and computer science

Recent Developments in Cooperative Control and Optimization

Sergiy Butenko,Robert Murphey,Panos M. Pardalos,2013-12-01 Over the past several years cooperative control and optimization has unquestionably been established as one of the most important areas of research in the military sciences Even so cooperative control and optimization transcends the military in its scope having become quite relevant to a broad class of systems with many exciting commercial applications One reason for all the excitement is that research has been so incredibly diverse spanning many scientific and engineering disciplines This latest volume in the Cooperative Systems book series clearly illustrates this trend towards diversity and creative thought And no wonder cooperative systems are among the hardest systems control science has endeavored to study hence creative approaches to modeling analysis and synthesis are a must The definition of cooperation itself is a slippery issue As you will see in this and previous volumes cooperation has been cast into many different roles and therefore has assumed many diverse meanings Perhaps the most we can say which unites these disparate concepts is that cooperation 1 requires more than one entity 2 the entities must have some dynamic behavior that influences the decision space 3 the entities share at least one common objective and 4 entities are able to share information about themselves and their environment Optimization and control have long been active fields of research in engineering

On Some Nonlinear Assignment Problems Vladyslav

Sokol, 2018 Linear assignment problem commonly referred to as just assignment problem is a fundamental problem in combinatorial optimization The goal is to assign n workers to do n jobs so that the linear sum of corresponding costs is minimized The linear assignment problem is thoroughly studied and has a $O(n^3)$ solution with Hungarian algorithm Nevertheless a wide range of applications involving assignments are naturally modeled with more complex objective functions for example quadratic sum as in quadratic assignment problem and are much more computationally challenging In this thesis we discuss our results on the bilinear assignment problem which generalizes the quadratic assignment problem and is also motivated by several unique applications The focus is on computational complexity solvable special cases approximations linearizations as well as local search algorithms and other heuristic approaches for the problem We also present our results on few applied projects where modelling the underlying problem as a nonlinear assignment was

Pardalos, J. Ben Rosen, 1987-07-15 Global optimization is concerned with the characterization and computation of global minima or maxima of nonlinear functions Such problems are widespread in mathematical modeling of real world systems for a very broad range of applications The applications include economies of scale fixed charges allocation and location problems quadratic assignment and a number of other combinatorial optimization problems More recently it has been shown that certain aspects of VLSI chip design and database problems can be formulated as constrained global optimization problems with a quadratic objective function Although standard nonlinear programming algorithms will usually obtain a local minimum to the problem such a local minimum will only be global when certain conditions are satisfied such as f and K being convex
