Non-Linear Variability in Geophysics D. Schertzer, S. Lovejoy, 1991 consequences of broken symmetry here parity is studied In this model turbulence is dominated by a hierarchy of helical corkscrew structures The authors stress the unique features of such pseudo scalar cascades as well as the extreme nature of the resulting intermittent fluctuations Intermittent turbulent cascades was also the theme of a paper by us in which we show that universality classes exist for continuous cascades in which an infinite number of cascade steps occur over a finite range of scales This result is the multiplicative analogue of the familiar central limit theorem for the addition of random variables Finally an interesting paper by Pasmanter investigates the scaling associated with anomalous diffusion in a chaotic tidal basin model involving a small number of degrees of freedom Although the statistical literature is replete with techniques for dealing with those random processes characterized by both exponentially decaying non scaling autocorrelations and exponentially decaying probability distributions there is a real paucity of literature appropriate for geophysical fields exhibiting either scaling over wide ranges e g algebraic autocorrelations or extreme fluctuations e g algebraic probabilities divergence of high order statistical moments In fact about the only relevant technique that is regularly used fourier analysis energy spectra permits only an estimate of a single power law exponent If the fields were mono fractal characterized by a single fractal dimension this would be sufficient however their generally multifractal character calls for the development of new techniques **Non-Linear**
