Recent Stability Issues for

Linear Dynamical Systems Nicola Guglielmi, Christian Lubich, Nicolas Gillis, Volker Mehrmann, Punit Sharma, Bart

Vandereycken, 2024-12-13 This book concerns matrix nearness problems in the framework of spectral optimization. It addresses some current research directions in spectral based stability studies for differential equations with material on ordinary differential equations, ODEs, differential algebraic equations, and dynamical systems. Here stability is interpreted in a broad sense which covers the need to develop stable and reliable algorithms preserving some qualitative properties of the computed solutions, methodologies which are helpful to assess the onset of potential instabilities or loss of robustness, and tools to determine the asymptotic properties of the solution or its discretization. The topics considered include the computation of robustness measures for linear problems, the use of low rank ODEs to approximate such measures via gradient systems, the regularity, stability, passivity, and controllability analysis of structured linear descriptor systems, and the use of acceleration techniques to deal with some of the presented computational problems. Although the emphasis is on the numerical study of differential equations and dynamical systems, the book will also be of interest to researchers in matrix theory, spectral optimization, and spectral graph theory, as well as in dynamical systems and systems theory. **Reliable**

Implementation of Real Number Algorithms: Theory and Practice Peter Hertling, Christoph M. Hoffmann, Wolfram

Luther, Nathalie Revol, 2008-08-06 A large amount of the capacity of today's computers is used for computations that can be described as computations involving real numbers. In this book, the focus is on a problem arising particularly in real number computations: the problem of veridically reliable computations. Since real numbers are objects containing an infinite amount of information, they cannot be represented precisely on a computer. This leads to the well-known problems caused by unverified implementations of real number algorithms using finite precision. While this is additionally seen to be a problem in numerical mathematics, there are also several scientific communities in computer science that are dealing with this problem. This book is a follow-up of the Dagstuhl Seminar 06021 on Reliable Implementation of Real Number Algorithms: Theory and Practice, which took place January 8-13, 2006. It was intended to stimulate an exchange of ideas between the different communities that deal with the problem of reliable implementation of real number algorithms, either from a theoretical or from a practical point of view. Forty-eight researchers from many different countries and many different disciplines gathered in the castle of Dagstuhl to exchange views and ideas in a relaxed atmosphere. The program consisted of 35 talks of 30 minutes each and of three evening sessions with additional presentations and discussions. There were also lively discussions about different theoretical models and practical approaches for reliable real number computations. Continuous System Simulation François E.
