Microbiological testing programs play an important role in the verification of the effectiveness of control measures for many food products Such programs may include monitoring of the production environment and processing equipment and testing of raw materials in process and finished products The relevance and application of testing programs depend upon the design of the product and process the hygienic status of the processing environment and the availability of other verification information about a product lot The design and implementation of environmental monitoring programs consider the areas of product exposure and the potential impact of the movement of people materials and product on product contamination Raw material testing programs consider the inherent risk of the material its use in the process and the confidence in the supplier determined by supplier audits and ongoing performance Finished product testing programs consider customer and regulatory requirements and the hygienic status of the process and production environment Due to statistical and temporal limitations microbiological testing programs are most effective when used along with risk based preventive controls such as HACCP hygienic zoning and other prerequisite programs and when they work together with other verification activities to assess the condition of a food safety system

Modelling Microorganisms in Food S. Brul, Suzanne van Gerwen, Marcel Zwietering, 2007-03-19 While predictive microbiology has made a major contribution to food safety many uncertainties linger such as the growing evidence that traditional microbial inactivation models do not always fit the experimental data and that all the bacteria of one population do not necessarily behave homogeneously These problems are all the more acute because of a growing interest in minimal processing techniques that is requiring greater precision from models Edited by leading authorities this volume reviews current developments in quantitative microbiology Part 1 discusses best practice in constructing quantitative models and Part 2 looks at specific areas in new approaches to modelling microbial behavior

Microorganisms in Foods 2 International Commission on Microbiological Specifications for Foods, 1986 The control of food safety in modern food processing relies upon HACCP and other systems that identify hazards and define processes to control them These demand a thorough understanding of the properties of microbial pathogens under all the conditions that could be found in foods and the food processing equipment Detailed information about each of the main organisms responsible for causing microbial food poisoning is presented here in an accessible and systematic way An overview of key properties for each organism is followed by a series of tables detailing the response of the organism under a range of variable conditions

HACCP, a Systematic Approach to Food Safety Virginia N. Scott, Kenneth E. Stevenson, 2006

Ensuring Global Food Safety Aleksandra Martinovic, Sangsuk Oh, Huub Lelieveld, 2022-02-10 Ensuring Global Food Safety Exploring Global Harmonization Second Edition examines the policies and practices of food law which remain top contributors to food waste. This fully revised and updated edition offers a rational and multifaceted approach to the science based issue of what is safe for consumption and how creating a globally acceptable framework of microbiological toxicological and nutritional standards can contribute to the alleviation of hunger and food insecurity in the world. Currently many laws and regulations are so stringent that healthy food is destroyed based on scientifically incorrect information upon which laws and regulations are based. This book illuminates these issues offering guidelines for moving toward a scientifically sound approach to food safety regulation that can also improve food security without putting consumers at risk. Presents the progress and current status of regulatory harmonization for food standards. Provides a science based foundation for global regulatory consensus. Approaches challenges from a risk benefit approach also including safety assurance. Includes global perspectives from governmental academic and industry experts.

Assessment and Management of Seafood Safety and Quality Hans Henrik Huss, Lahsen Ababouch, Lone Gram, Food and Agriculture Organization of the United Nations, 2004 This paper brings together current knowledge on fish safety and quality issues. Topics discussed include a summary of world fish production and consumption developments in safety and quality systems and a review of public health hazards regarding fish and fish products risk mitigation and management tools including requirements for the implementation of the Good Hygienic and Manufacturing Practices (GHP/GMP), the Hazard Analysis Critical Control Point (HACCP) system and of the monitoring programmes to control biotoxins, pathogenic bacteria and viruses and chemical pollutants. The use of the HACCP approach to target other non safety quality issues, predictive microbiology, traceability and examples of food safety objectives.
