**Models for Count Data** William Greene,2007 This study presents several extensions of the most familiar models for count data the Poisson and negative binomial models We develop an encompassing model for two well known variants of the negative binomial model the NB1 and NB2 forms We then analyze some alternative approaches to the standard log gamma model for introducing heterogeneity into the loglinear conditional means for these models The lognormal model provides a versatile alternative specification that is more flexible and more natural than the log gamma form and provides a platform for several two part extensions including zero inflation hurdle and sample selection models We briefly present some alternative approaches to modeling heterogeneity We also resolve some features in Hausman Hall and Griliches 1984 Economic models for count data with an application to the patents R D relationship *Econometrica* 52 909 938 widely used panel data treatments for the Poisson and negative binomial models that appear to conflict with more familiar models of fixed and random effects Finally we consider a bivariate Poisson model that is also based on the lognormal heterogeneity model Two recent applications have used this model We suggest that the correlation estimated in their model frameworks is an

ambiguous measure of the correlation of the variables of interest and may substantially overstate it We conclude with a detailed application of the proposed methods using the data employed in one of the two aforementioned bivariate Poisson studies *Applied Panel Data Analysis for Economic and Social Surveys* Hans-Jürgen Andreß, Katrin Golsch, Alexander W. Schmidt, 2013-01-24 Many economic and social surveys are designed as panel studies which provide important data for describing social changes and testing causal relations between social phenomena This textbook shows how to manage, describe and model these kinds of data It presents models for continuous and categorical dependent variables focusing either on the level of these variables at different points in time or on their change over time It covers fixed and random effects models, models for change scores and event history models All statistical methods are explained in an application centered style using research examples from scholarly journals which can be replicated by the reader through data provided on the accompanying website As all models are compared to each other it provides valuable assistance with choosing the right model in applied research The textbook is directed at master and doctoral students as well as applied researchers in the social sciences psychology business administration and economics Readers should be familiar with linear regression and have a good understanding of ordinary least squares estimation
