Micromanipulation in Assisted Conception Steven D. Fleming, Robert S. King, 2003-11-06 This guide to micromanipulation techniques for assisted conception in a clinical setting includes detailed descriptions of all common micromanipulation systems currently in use in IVF laboratories In explaining how to optimize their successful use the volume covers state of the art techniques including ICSI and procedures such as assisted hatching and the blastomere biopsy for PGD Valuable information on troubleshooting mechanical and technical difficulties is provided to help professionals ranging from technicians to consultant obstetricians master the techniques Thrombosis and Haemostasis, 2007 **NETosis 2: The Excitement Continues** Mariana J. Kaplan, Marko Radic, Martin Herrmann, 2017-12-28 NETosis a form of cell death that manifests by the release of decondensed chromatin to the extracellular space provides valuable insights into mechanisms and consequences of cellular demise Because extracellular chromatin can immobilize microbes the extended nucleohistone network was called a neutrophil extracellular trap NET and the process of chromatin release was proposed to serve an innate immune defense function Extracellular chromatin NETs were initially observed in studies of neutrophils and are most prominent in these types of granulocytes Subsequent studies showed that other granulocytes and in a limited way other cells of the innate immune response may also release nuclear chromatin following certain kinds of stimulation Variations of NETosis were noted with cells that remain temporarily motile after the release of chromatin Numerous stimuli for NETosis were discovered including bacterial breakdown products inflammatory stimuli particulate matter certain crystals immune complexes and activated thrombocytes Fundamental explorations into the mechanisms of NETosis observed that neutrophil enzyme activity PAD4 neutrophil elastase proteinase 3 and myeloperoxidase and signal transduction pathways contribute to the regulation of NETosis Histones in NET chromatin become modified by peptidylarginine deiminase 4 PAD4 and cleaved at specific sites by proteases leading to extensive chromatin externalization In addition NETs serve for attachment of bactericidal enzymes including myeloperoxidase leukocyte proteases and the cathelicidin LL 37 NETs are decorated with proteases and may thus contribute to tissue destruction However the attachment of these enzymes to NET associated supramolecular structures restricts systemic spread of the proteolytic activity While the benefit of NETs in an infection appears obvious NETs also participate as key protagonists in various pathologic states Therefore it is essential for NETs to be efficiently cleared otherwise digestive enzymes may gain access to tissues where inflammation takes place Persistent NET exposure at sites of inflammation may lead to a further complication NET antigens may provoke acquired immune responses and over time could initiate autoimmune reactions serve as antigen for nuclear autoantibodies and foster DNA immune complex related inflammation Neutrophil products and deiminated proteins comprise an important group of autoantigens in musculoskeletal disorders Aberrant NET synthesis and or clearance are often associated with inflammatory and autoimmune conditions Recent evidence also implicates aberrant NET formation in the development of endothelial damage

atherosclerosis and thrombosis Intravital microscopy provides evidence for conditions that induce NETosis in vivo Furthermore NETs can easily be detected in synovial fluid and tissue sections of patients with arthritis and gout NETosis is thus of interest to researchers who investigate innate immune responses host pathogen interactions chronic inflammatory disorders cell and vascular biology biochemistry and autoimmunity As we enter the second decade of research on NETosis it is useful and timely to review the mechanisms and pathways of NET formation their role in bacterial and fungal defense and their importance as inducers of autoimmune responses

Neuronal Mechanics and Transport Daniel M. Suter,Kyle E. Miller,2016-05-26 Understanding the underlying mechanisms of how axons and dendrites develop is a fundamental problem in neuroscience and a main goal of research on nervous system development and regeneration Previous studies have provided a tremendous amount of information on signaling and cytoskeletal proteins regulating axonal and dendritic growth and guidance However relatively little is known about the relative contribution and role of cytoskeletal dynamics transport of organelles and cytoskeletal components and force generation to axonal elongation Advancing the knowledge of these biomechanical processes is critical to better understand the development of the nervous system the pathological progression of neurodegenerative diseases acute traumatic injury and for designing novel approaches to promote neuronal regeneration following disease stroke or trauma Mechanical properties and forces shape the development of the nervous system from the cellular up to the organ level Recent advances in quantitative live cell imaging biophysical and nanotechnological methods such as traction force microscopy optical tweezers and atomic force microscopy have enabled researchers to gain better insights into how cytoskeletal dynamics and motor driven transport membrane dynamics adhesion and substrate rigidity influence axonal elongation Given the complexity and mechanical nature of this problem mathematical modeling contributes significantly to our understanding of neuronal mechanics Nonetheless there has been limited direct interaction and discussions between experimentalists and theoreticians in this research area The purpose of this Frontiers Research Topic is to highlight exciting and important work that is currently developing in the fields of neuronal cell biology neuronal mechanics intracellular transport and mathematical modeling in the form of primary research articles reviews perspectives and commentaries

Autophagy in plants and algae Diane C Bassham,Jose L Crespo,2015-05-15 Autophagy also known as macroautophagy is an evolutionarily conserved process by which cytoplasmic components are nonselectively enclosed within a double membrane vesicle known as the autophagosome and delivered to the vacuole for degradation of toxic components and recycling of needed nutrients This catabolic process is required for the adequate adaptation and response of the cell and correspondingly the whole organism to different types of stress including nutrient starvation or oxidative damage Autophagy has been extensively

investigated in yeasts and mammals but the identification of autophagy related ATG genes in plant and algal genomes together with the characterization of autophagy deficient mutants in plants have revealed that this process is structurally and functionally conserved in photosynthetic eukaryotes Recent studies have demonstrated that autophagy is active at a basal level under normal growth in plants and is upregulated during senescence and in response to nutrient limitation oxidative stress salt and drought conditions and pathogen attack Autophagy was initially considered as a non selective pathway but numerous observations mainly obtained in yeasts revealed that autophagy can also selectively eliminate specific proteins protein complexes and organelles Interestingly several types of selective autophagy appear to be also conserved in plants and the degradation of protein aggregates through specific adaptors or the delivery of chloroplast material to the vacuole via autophagy has been reported This research topic aims to gather recent progress on different aspects of autophagy in plants and algae We welcome all types of articles including original research methods opinions and reviews that provide new insights about the autophagy process and its regulation
