

What is Marine Biology?

Marine biology is the study of life in the ocean. This huge body of saltwater covers about two-thirds of our planet's surface and contains many different marine ecosystems. Life within it is more diverse than life on land!

Coral reefs are giant ecosystems built by thousands of tiny organisms called coral polyps. The outside of a coral reef is alive, while the inside is made up of the skeletons of dead coral. They are found in shallow water. The algae that live with them need the sunlight for photosynthesis.

Mangroves can grow along coastlines. They are mangrove trees with roots that grow in shallow water. They are found in hundreds of other creatures.

Life in the Ocean

Sea creatures have special adaptations that allow them to live underwater.

The flounder is a fish that can disguise itself to mimic its surroundings. Its ability to camouflage helps it to survive.

Humans get oxygen through their lungs. Fish get oxygen through their gills.

Sea turtles have flippers that help them move quickly through the water.

An octopus can change its color to match its surroundings.

... breathing air through their lungs.
