Scheduling Michael L. Pinedo, 2012-01-07 This new edition of the well established text *Scheduling Theory Algorithms and Systems* provides an up to date coverage of important theoretical models in the scheduling literature as well as significant scheduling problems that occur in the real world. It again includes supplementary material in the form of slide shows from industry and movies that show implementations of scheduling systems. The main structure of the book as per previous edition consists of three parts. The first part focuses on deterministic scheduling and the related combinatorial problems. The second part covers probabilistic scheduling models in this part it is assumed that processing times and other problem data are random and not known in advance. The third part deals with scheduling in practice it covers heuristics that are popular with practitioners and discusses system design and implementation issues. All three parts of this new edition have been revamped and streamlined. The references have been made completely up to date. Theoreticians and practitioners alike will find this book of interest. Graduate students in operations management operations research industrial engineering and computer science will find the book an accessible and invaluable resource. *Scheduling Theory Algorithms and Systems* will serve as an essential reference for professionals working on scheduling problems in manufacturing services and other environments. Reviews of third edition This well established text covers both the theory and practice of scheduling. The book begins with motivating examples and the penultimate chapter discusses some commercial scheduling systems and examples of their implementations. Mathematical Reviews 2009 *Scheduling* Michael L. Pinedo, 2022-12-13 The sixth edition provides expanded Discussion and Comments and References sections at the end of each chapter creating a spotlight on practical applications of the theory presented in that chapter. New topics include rules for stochastic parallel machine scheduling and for stochastic online scheduling models of flow shops with reentry fixed parameter tractability and new designs and implementations of scheduling systems. Scheduling Michael Pinedo, 2002 Focusing on theory and applications of scheduling the applications are drawn primarily

from production and manufacturing environments but state principles that are relevant to other settings as well The broad range of topics includes deterministic and stochastic models **Data-Intensive Workflow Management** Daniel C. M. de Oliveira,Ji Liu,Esther Pacitti,2022-06-01 Workflows may be defined as abstractions used to model the coherent flow of activities in the context of an *in silico* scientific experiment They are employed in many domains of science such as bioinformatics astronomy and engineering Such workflows usually present a considerable number of activities and activations i e tasks associated with activities and may need a long time for execution Due to the continuous need to store and process data efficiently making them data intensive workflows high performance computing environments allied to parallelization techniques are used to run these workflows At the beginning of the 2010s cloud technologies emerged as a promising environment to run scientific workflows By using clouds scientists have expanded beyond single parallel computers to hundreds or even thousands of virtual machines More recently Data Intensive Scalable Computing DISC frameworks e g Apache Spark and Hadoop and environments emerged and are being used to execute data intensive workflows DISC environments are composed of processors and disks in large commodity computing clusters connected using high speed communications switches and networks The main advantage of DISC frameworks is that they support and grant efficient in memory data management for large scale applications such as data intensive workflows However the execution of workflows in cloud and DISC environments raise many challenges such as scheduling workflow activities and activations managing produced data collecting provenance data etc Several existing approaches deal with the challenges mentioned earlier This way there is a real need for understanding how to manage these workflows and various big data platforms that have been developed and introduced As such this book can help researchers understand how linking workflow management with Data Intensive Scalable Computing can help in understanding and analyzing scientific big data In this book we aim to identify and distill the body of work on workflow management in clouds and DISC environments We start by discussing the basic principles of data intensive scientific workflows Next we present two workflows that are executed in a single site and multi site clouds taking advantage of provenance Afterward we go towards workflow management in DISC environments and we present in detail solutions that enable the optimized execution of the workflow using frameworks such as Apache Spark and its extensions

Deterministic and Stochastic Scheduling M.A. Dempster, 1982-04-30 This volume contains the proceedings of an Advanced Study and Research Institute on Theoretical Approaches to Scheduling Problems The Institute was held in Durham England from July 6 to July 17 1981 It was attended by 91 participants from fifteen different countries The format of the

Institute was somewhat unusual. The first eight of the ten available days were devoted to an Advanced Study Institute with lectures on the state of the art with respect to deterministic and stochastic scheduling models and on the interface between these two approaches. The last two days were occupied by an Advanced Research Institute where recent results and promising directions for future research especially in the interface area were discussed. Altogether 37 lectures were delivered by 24 lecturers. They have all contributed to these proceedings the first part of which deals with the Advanced Study Institute and the second part of which covers the Advanced Research Institute. Each part is preceded by an introduction written by the editors. While confessing to a natural bias as organizers we believe that the Institute has been a rewarding and enjoyable event for everyone concerned. Time-Dependent Scheduling Stanislaw Gawiejnowicz, 2008-09-26. Time dependent scheduling involves problems in which the processing times of jobs depend on when those jobs are started. This book is a comprehensive study of complexity results and optimal and suboptimal algorithms concerning time dependent scheduling in single parallel and dedicated machine environments. In addition to complexity issues and exact or heuristic algorithms which are typically presented in scheduling books the author also includes more advanced topics such as matrix methods in time dependent scheduling and time dependent scheduling with two criteria. The reader should be familiar with basic notions of calculus, discrete mathematics and combinatorial optimization theory while the book offers introductory material on NP complete problems and the basics of scheduling theory. The author includes numerous examples figures and tables he presents different classes of algorithms using pseudocode and he completes the book with an extensive bibliography and author symbol and subject indexes. The book is suitable for researchers working on scheduling problem complexity optimization heuristics and local search algorithms.

Scheduling with Time-Changing Effects and Rate-Modifying Activities Vitaly A. Strusevich, Kabir Rustogi, 2016-10-18. In scheduling theory the models that have attracted considerable attention during the last two decades allow the processing times to be variable i.e. to be subjected to various effects that make the actual processing time of a job dependent on its location in a schedule. The impact of these effects includes but is not limited to deterioration and learning. Under the first type of effect the later a job is scheduled the longer its actual processing time becomes. In the case of learning delaying a job will result in shorter processing times. Scheduling with Time Changing Effects and Rate Modifying Activities covers and advances the state of the art research in this area. The book focuses on single machine and parallel machine scheduling problems to minimize either the maximum completion time or the sum of completion times of all jobs provided that the processing times are subject to various effects. Models that describe deterioration learning and general non monotone effects to be considered include positional start time dependent cumulative and their combinations which cover most of the traditionally used models. The authors also consider more enhanced models in which the decision maker may insert certain Rate Modifying Activities RMA on processing machines such as for example

maintenance or rest periods In any case the processing times of jobs are not only dependent on effects mentioned above but also on the place of a job in a schedule relative to an RMA For most of the enhanced models described in the book polynomial time algorithms are presented which are based on similar algorithmic ideas such as reduction to linear assignment problems in a full form or in a reduced form discrete convexity and controlled generation of options *Scheduling Algorithms* Peter Brucker, 2007-07-18 Besides scheduling problems for single and parallel machines and shop scheduling problems the book covers advanced models involving due dates sequence dependent changeover times and batching Also multiprocessor task scheduling and problems with multi purpose machines are discussed The methods used to solve these problems are linear programming dynamic programming branch and bound algorithms and local search heuristics Complexity results for different classes of deterministic scheduling problems are summarized *Scheduling Theory. Single-Stage Systems*

Viatcheslav Sergeevich Tanaev, Valerii Sergeevich Gordon, 1994-05-31 Scheduling theory is an important branch of operations research Problems studied within the framework of that theory have numerous applications in various fields of human activity As an independent discipline scheduling theory appeared in the middle of the fifties and has attracted the attention of researchers in many countries In the Soviet Union research in this direction has been mainly related to production scheduling especially to the development of automated systems for production control In 1975 Nauka Science Publishers Moscow issued two books providing systematic descriptions of scheduling theory The first one was the Russian translation of the classical book Theory of Scheduling by American mathematicians R W Conway W L Maxwell and L W Miller The other one was the book Introduction to Scheduling Theory by Soviet mathematicians V S Tanaev and V V Shkurba These books well complement each other Both books well represent major results known by that time contain an exhaustive bibliography on the subject Thus the books as well as the Russian translation of Computer and Job Shop Scheduling Theory edited by E G Coffman Jr Nauka 1984 have contributed to the development of scheduling theory in the Soviet Union Many different models the large number of new results make it difficult for the researchers who work in related fields to follow the fast development of scheduling theory and to master new methods and approaches quickly
