Cancer Paul D. Rennert, 2016-05-30 Cancer care is undergoing a radical transformation as novel technologies are directed toward new treatments and personalized medicine The most dramatic advances in the treatment of cancer have come from therapeutics that augment the immune response to tumors The immune checkpoint inhibitors are the best known and most highly advanced examples of Immune Therapeutics targeting tumor cells and include approved antibody drugs directed at the cell surface proteins CTLA4 and PD 1 These are now considered foundational treatments for several solid tumor indications and that list of indications is growing quickly More broadly antibodies have become workhorse molecules across the entire immunotherapy landscape Antibodies to novel targets modulate the activity of diverse immune cell regulatory proteins Engineered antibodies can induce tumor cell death or expose tumor cells to poisonous toxins ADCC and ADC respectively Bi specific antibodies can engage multiple tumor targets simultaneously or can redirect lymphocytes to attack tumor cells The antigen binding domains within antibodies can be spliced onto cell stimulatory domains and transduced into T cells or NK cells creating remarkable tumor specific cellular therapeutics CAR T CAR NK Beyond antibody based therapies there are highly diverse and differentiated technology tool kits being applied to immunotherapy Small molecule drugs are being developed to attack the tumor microenvironment novel tumor vaccine approaches are showing great promise patient lymphocytes are being isolated expanded and reintroduced to patients gene editing techniques are becoming widely deployed and a vast number of new tumor targets and mutated tumor proteins neoantigens are being discovered The past decade has seen unprecedented success in the treatment of diverse cancers The authors of this volume have been asked to not only review progress to date but importantly to look ahead and anticipate the evolution of cancer treatment across diverse Immune Therapeutic approaches Our hypothesis is that the advances we are seeing across the immunotherapy landscape will further evolve and synergize leading us finally to outright cures for many cancers

Cancer Immunology and Immunotherapy Glenn Dranoff, 2011-04-11 The interplay between tumors and their immunologic microenvironment is complex difficult to decipher but its understanding is of seminal importance for the development of novel prognostic markers and therapeutic strategies The present review discusses tumor immune interactions in several human cancers that illustrate various aspects of this complexity and proposes an integrated scheme of the impact of local immune reactions on clinical outcome Current active immunotherapy trials have shown durable tumor regressions in a fraction of patients However clinical efficacy of current vaccines is limited possibly because tumors skew the immune system by means of myeloid derived suppressor cells

inflammatory type 2 T cells and regulatory T cells Tregs all of which prevent the generation of effector cells To improve the clinical efficacy of cancer vaccines in patients with metastatic disease we need to design novel and improved strategies that can boost adaptive immunity to cancer help overcome Tregs and allow the breakdown of the immunosuppressive tumor microenvironment
