Optical Characterization Of Epitaxial Semiconductor Layers:

Optical Characterization of Epitaxial Semiconductor Layers Günther Bauer, Wolfgang Richter, 2012-12-06 The characterization of epitaxial layers and their surfaces has benefitted a lot from the enormous progress of optical analysis techniques during the last decade In particular the dramatic improvement of the structural quality of semiconductor epilayers and heterostructures results to a great deal from the level of sophistication achieved with such analysis techniques First of all optical techniques are nondestructive and their sensitivity has been improved to such an extent that nowadays the epilayer analysis can be performed on layers with thicknesses on the atomic scale Furthermore the spatial and temporal resolution have been pushed to such limits that real time observation of surface processes during epitaxial growth is possible with techniques like reflectance difference spectroscopy Of course optical spectroscopies complement techniques based on the interaction of electrons with matter but whereas the latter usually require high or ultrahigh vacuum conditions the former ones can be applied in different environments as well This advantage could turn out extremely important for a rather technological point of view i e for the surveillance of modern semiconductor processes Despite the large potential of techniques based on the interaction of electromagnetic waves with surfaces and epilayers optical techniques are apparently moving only slowly into this area of technology One reason for this might be that some prejudices still exist regarding their sensitivity

Nondestructive Characterization of Materials XI Robert E. Green, B. Boro Djordjevic, 2003-06-18 The papers published in these proceedings represent the latest developments in the nondestructive characterization of materials and were presented at the Eleventh International Symposium on Nondestructive Characterization of Materials held in June 24-28 2002 in Berlin Germany

Heteroepitaxy of Semiconductors John E. Ayers, 2018-10-08 Heteroepitaxy has evolved rapidly in recent years With each new wave of material substrate combinations our understanding of how to control crystal growth becomes more refined Most books on the subject focus on a specific material or material family narrowly explaining the processes and techniques appropriate for each Surveying the principles common to all types of semiconductor materials Heteroepitaxy of Semiconductors Theory Growth and Characterization is the first comprehensive fundamental introduction to the field This book reflects our current understanding of nucleation growth modes relaxation of strained layers and dislocation dynamics without emphasizing any particular material Following an overview of the properties of semiconductors the author introduces the important heteroepitaxial growth methods and provides a survey of semiconductor crystal surfaces their structures and nucleation With this foundation the book provides in depth descriptions of mismatched heteroepitaxy and lattice strain relaxation various characterization tools used to monitor and evaluate the growth process and finally defect engineering approaches Numerous examples highlight the concepts while extensive micrographs schematics of experimental setups and graphs illustrate the discussion Serving as a solid starting point for this rapidly evolving area Heteroepitaxy of Semiconductors Theory Growth and Characterization makes the principles of heteroepitaxy easily accessible to anyone
