Econometric Models with Panel Data César Pérez López, 2015-01-20 Data panels are a special type of samples in which the behavior of a certain number of economic agents is followed over time In this way the researcher can perform economic analysis and specify models with the data of cross section or cross section that are obtained when all operators are considered in an instant of time Different patterns of behaviour of all players together studied in the different temporal moments may thus be assessed Alternatively you can perform the same analysis considering time series given by the evolution of each economic agent throughout all the periods of the sample In the latter case could be considered different patterns for individual to individual behaviour all the time interval of the sample The book focuses on practical aspects of econometrics of panel data presenting variety of solved exercise with the latest software STATA SAS SPSS and EViews software was used The remarkable reads as follows

 QUANTILE REGRESSION A thorough presentation of Quantile Regression designed to help readers obtain richer information
 from data analyses The conditional least square or mean regression MR analysis is the quantitative research method used to
 model and analyze the relationships between a dependent variable and one or more independent variables where each
 equation estimation of a regression can give only a single regression function or fitted values variable As an advanced mean
 regression analysis each estimation equation of the mean regression can be used directly to estimate the conditional quantile
 regression QR which can quickly present the statistical results of a set nine QR s for tau s from 0.1 up to 0.9 to predict detail
