

Metamorphic Rocks

1. Metamorphism is the process where a rock changes form or mineral content as a result of environmental changes such as heat and pressure.
2. Every metamorphic rock has parent rock, the rock that was altered by metamorphism.
3. Do the original rocks melt, and then recrystallize? Or do they experience other effects? Explain what happens.
The rocks go through metamorphism, which is effected by temperature, pressure, and fluids. the higher the grade the more organized their bands are. they can either become foliated or non-foliated depending on the parent rock.
4. The grade of a rock changes because the rock is subject to new conditions, increased temperature and/or pressure.
5. metamorphic grade is the degree to which a parent rock changes during metamorphism.
6. List the four agents of metamorphism:
 - a. parent rock
 - b. temperature
 - c. pressure
 - d. fluids
7. recrystallization is the process by which new mineral grains larger than the original mineral grains form as a result of metamorphic heat.
8. Rocks subjected to shear stress are shortened in the direction of greatest stress. Along convergent boundaries, the greatest differential stress is directed horizontally in the direction of plate motion.
9. The metamorphic texture, Foliation refers to roughly parallel layers of mineral crystals aligned perpendicular to the direction of pressure.
10. limestone is parent rock to marble.
