Analysis of Memory Transfers and GEMM Subroutines on NVIDIA Tesla GPU Cluster, 2009 Commodity clusters augmented with application accelerators are evolving as competitive high performance computing systems The Graphical Processing Unit GPU with a very high arithmetic density and performance per price ratio is a good platform for the scientific application acceleration In addition to the interconnect bottlenecks among the cluster compute nodes the cost of memory copies between the host and the GPU device have to be carefully amortized to improve the overall efficiency of the application Scientific applications also rely on efficient implementation of the BASic Linear Algebra Subroutines BLAS among which the General Matrix Multiply GEMM is considered as the workhorse subroutine In this paper they study the performance of the memory copies and GEMM subroutines that are critical to port the computational chemistry algorithms to the GPU clusters To that end a benchmark based on the NetPIPE framework is developed to evaluate the latency and bandwidth of the memory copies between the host and the GPU device The performance of the single and double precision GEMM subroutines from the NVIDIA CUBLAS 2.0 library are studied The results have been compared with that of the BLAS routines from the Intel Math Kernel Library MKL to understand the computational trade offs The test bed is a Intel Xeon cluster equipped with NVIDIA Tesla GPUs

Architectural Analysis and Performance Characterization of NVIDIA GPUs Using Microbenchmarking Saktheesh Subramoniapillai Ajeetha, 2012. Abstract: Emergence of new Graphical Processors for general purpose computing presents new challenges for application developers. Graphical Processors vary in terms of number of processor cores per chip, processor speed, and memory subsystems. NVIDIA's CUDA provides a C-like abstraction layer for software developers to implement their applications on GPUs often with little knowledge of the underlying hardware, and they are forced to work with high-level descriptions documented by the manufacturer. Substantial knowledge of the hardware architecture will be useful for harvesting the full potential of GPU architectures while trying to solve complex parallel programming problems. This work reports the measurements and characterization of performance of several NVIDIA GPUs using microbenchmark analysis. Our thesis uses and adapts the CUDA Micro benchmarks 8 and SHOC benchmarks 9 to characterize the important aspects of NVIDIA's GTX200 series GPU architecture machine GTX280 and Fermi series architecture machines GTX580, Tesla C2050. The investigation is conducted by performing a micro architectural analysis of these machines and comparing their basic performance parameters. This thesis presents an experiment-based methodology for characterizing the properties of the arithmetic pipelines. We also measure the global and shared memory latency and bandwidth of these machines and validate the hardware characteristics presented in the CUDA programming guide. We hope that the insights from this work will be useful for improving the analysis and performance optimization of CUDA programs.
