## **Negative Binomial Regression:**

**Negative Binomial Regression** Joseph M. Hilbe, 2011-03-17 This second edition of Hilbe's Negative Binomial Regression is a substantial enhancement to the popular first edition. The only text devoted entirely to the negative binomial model and its many variations nearly every model discussed in the literature is addressed. The theoretical and distributional background of each model is discussed together with examples of their construction, application, interpretation and evaluation. Complete Stata and R codes are provided throughout the text with additional code plus SAS derivations and data provided on the book's website. Written for the practising researcher the text begins with an examination of risk and rate ratios and of the estimating algorithms used to model count data. The book then gives an in depth analysis of Poisson regression and an evaluation of the meaning and nature of overdispersion followed by a comprehensive analysis of the negative binomial distribution and of its parameterizations into various models for evaluating count data.

*A Disaggregate Negative Binomial Regression Procedure for Count Data Analysis*

Venkatram Ramaswamy, Eugene Anderson, Wayne S. DeSarbo, 2016 Various research areas face the methodological problems presented by nonnegative integer count data drawn from heterogeneous populations. We present a disaggregate negative binomial regression procedure for analysis of count data observed for a heterogeneous sample of cross sections possibly over some fixed time periods. This procedure simultaneously pools or groups cross sections while estimating a separate negative binomial regression model for each group. An E-M algorithm is described within a maximum likelihood framework to estimate the group proportions, the group specific regression coefficients and the degree of overdispersion in event rates within each derived group. The proposed procedure is illustrated with count data entailing nonnegative integer counts of purchases events for a frequently bought consumer good

*Poisson Versus Negative Binomial Regression in the Analysis of Count Data*

Barbie Ann L. Bugna, 2015 Commonly used tests for treatment effect in  $k \times 2$  frequency data are Poisson regression, negative binomial regression and Cochran Mantel Haentzel. In practice Poisson regression or CMH is used as default and NB regression is used only when there is reason to believe the data has overdispersion beyond what is expected of Poisson

counts We show that the Poisson regression is sensitive to the Poisson assumption and does not maintain its size in the presence of overdispersion In particular it tends to interpret overdispersion as significant treatment effect Thus there is a need for a reliable pretest for the Poisson assumption A commonly used diagnostic for overdispersion is a Wald test of the estimated overdispersion parameter however this has convergence problems We propose a simpler Hogg type diagnostic that has no convergence problems and is easy to compute

#### The Relative Performance of Poisson and Negative Binomial

Regression Estimators McKinley L. Blackburn,2015 Negative binomial estimators are commonly used in estimating models with count data dependent variables In this paper sampling experiments are used to evaluate the performance of these estimators relative to the simpler Poisson estimator in finite sample situations The results do not suggest a clear preference for negative binomial estimators in situations in which the underlying dependent variables are overdispersed unless the researcher is comfortable in assumptions about the precise form of the overdispersion

#### Econometric Analysis of Health

Data Andrew M. Jones,Owen O'Donnell,2002-05-17 Given extensive use of individual level data in Health Economics it has become increasingly important to understand the microeconometric techniques available to applied researchers The purpose of this book is to give readers convenient access to a collection of recent contributions that contain innovative applications of microeconometric methods to data on health and health care Contributions are selected from papers presented at the European Workshops on Econometrics and Health Economics and published in Health Economics Topics covered include Latent Variables Unobservable heterogeneity and selection problems Count data and survival analysis Flexible and semiparametric estimators for limited dependent variables Classical and simulation methods for panel data Publication marks the tenth anniversary of the Workshop series Doctoral students and researchers in health economics and microeconomics will find this book invaluable Researchers in related fields such as labour economics and biostatistics will also find the content of use

#### Applied Survey Data Analysis Brady T. West,Steve G. Heeringa,Patricia A. Berglund,2025-04-15

Highly recommended by the Journal of Official Statistics The American Statistician and other top statistical journals Applied Survey Data Analysis Third Edition provides an up to date overview of state of the art approaches to the analysis of complex sample survey data Building on the wealth of material on practical approaches to descriptive analysis and regression modeling from the first and second editions this third edition further expands the topics covered and presents more step by step examples of modern approaches to the analysis of survey data using the newest statistical software procedures New to the Third Edition Applied Bayesian methods for the analysis of complex sample survey data using available software implementing these methods State of the art methods and software for the analysis of survey data collected from non probability samples Software for modern applications of machine learning techniques to complex sample survey data A completely revamped website providing code for replicating all the analyses illustrated in the book using Stata SAS SPSS R Mplus SUDAAN WesVar and IVEware New end of chapter exercises allowing for practice implementing the methods including Bayesian

analysis exercises Updated summaries of the newest literature on the analysis of survey data collected from complex samples An updated review of software packages currently available for the analysis of complex sample survey data Designed for readers working in a wide array of disciplines who conduct secondary analyses of survey data as part of their applied work this book continues to provide a practical and accessible guide to the analysis of survey data Continuing to use an example driven approach to clearly illustrate analysis methods and software the third edition contains many new examples and practical exercises based on recent versions of real world survey data sets Although the authors continue to use Stata for most examples in the text they also offer the newest code for replicating the examples in other popular software packages on the book's revamped website

This study presents several extensions of the most familiar models for count data the Poisson and negative binomial models We develop an encompassing model for two well known variants of the negative binomial model the NB1 and NB2 forms We then analyze some alternative approaches to the standard log gamma model for introducing heterogeneity into the loglinear conditional means for these models The lognormal model provides a versatile alternative specification that is more flexible and more natural than the log gamma form and provides a platform for several two part extensions including zero inflation hurdle and sample selection models We briefly present some alternative approaches to modeling heterogeneity We also resolve some features in Hausman Hall and Griliches 1984 Economic models for count data with an application to the patents R D relationship *Econometrica* 52 909 938 widely used panel data treatments for the Poisson and negative binomial models that appear to conflict with more familiar models of fixed and random effects Finally we consider a bivariate Poisson model that is also based on the lognormal heterogeneity model Two recent applications have used this model We suggest that the correlation estimated in their model frameworks is an ambiguous measure of the correlation of the variables of interest and may substantially overstate it We conclude with a detailed application of the proposed methods using the data employed in one of the two aforementioned bivariate Poisson studies **On Estimation and Influence Diagnostics for Zero-inflated Negative Binomial Regression Models**
