## **Nuclear Computational Science A Century In Review:**

**Nuclear Computational Science** Yousry Azmy, Enrico Sartori, 2010-04-15 Nuclear engineering has undergone extensive progress over the years. In the past century colossal developments have been made and with specific reference to the mathematical theory and computational science underlying this discipline advances in areas such as high order discretization methods Krylov Methods and Iteration Acceleration have steadily grown. Nuclear Computational Science A Century in Review addresses these topics and many more topics which hold special ties to the first half of the century and topics focused around the unique combination of nuclear engineering computational science and mathematical theory. Comprising eight chapters Nuclear Computational Science A Century in Review incorporates a number of carefully selected issues representing a variety of problems providing the reader with a wealth of information in both a clear and concise manner. The comprehensive nature of the coverage and the stature of the contributing authors combine to make this a unique landmark publication. Targeting the medium to advanced level academic this book will appeal to researchers and students with an interest in the progression of mathematical theory and its application to nuclear computational science. Computational Methods in Transport Frank Graziani, 2006-02-17 There exist a wider range of applications where as the fraction of the momentum and energy present in a physical problem is carried by the transport of particles. Depending on the specific application the particles involved may be photons neutrons neutrinos or charged particles. Regardless of which phenomena is being described at the heart of each application is the fact that a Boltzmann like transport equation has to be solved. The complexity and hence expense involved in solving the transport problem can be understood by realizing that the general solution to the 3D Boltzmann transport equation is in fact really seven dimensional 3 spatial coordinates 2 angles 1 time and 1 for speed or energy. Low order approximations to the transport equation are frequently used due in part to physical justification but many in cases simply because a solution to the full transport problem is too computationally expensive. An example is the diffusion equation which effectively drops the two angles in phase space by assuming that a linear representation in angle is adequate. Another approximation is the grey approximation which drops the energy variable by averaging over it. If the grey approximation is applied to the diffusion equation the expense of solving what amounts to the simplest possible description of transport is roughly equal to the cost of implicit computational fluid dynamics. It is clear therefore that for those application areas needing some form of transport fast accurate and robust transport algorithms can lead to an increase in overall code performance and a decrease in time to solution. **High Performance Computing for Computational Science -**

**VECPAR 2004** Michel Daydé, Jack Dongarra, Vincente Hernández, José M.L.M. Palma, 2005-04-28 VECPar is a series of international conferences dedicated to the promotion and advancement of all aspects of high performance computing for computational science as an industrial technique and academic discipline extending the frontier of both the state of the art and the state of practice. The audience for and participants in VECPar are seen as researchers in academic departments.

ernment laboratories and industrial organizations There is now a permanent website for the series <http://vecpar.fe.up.pt> where the history of the conferences is described The sixth edition of VECPAR was the first time the conference was celebrated outside Porto at the Universidad Politecnica de Valencia Spain June 28-30 2004 The whole conference programme consisted of 6 invited talks 61 papers and 26 posters out of 130 contributions that were initially submitted The major themes were divided into large scale numerical and non numerical simulations parallel and grid computing biosciences numerical algorithms data mining and visualization This postconference book includes the best 48 papers and 5 invited talks presented during the three days of the conference The book is organized into 6 chapters with a prominent position reserved for the invited talks and the Best Student Paper As a whole it appeals to a wide research community from those involved in the engineering applications to those interested in the actual details of the hardware or software implementations in line with what in these days tends to be considered as computational science and engineering CSE
