## **Numerical Methods And Optimization In Finance:**

**Numerical Methods and Optimization in Finance** Manfred Gilli, Dietmar Maringer, Enrico Schumann, 2019-08-16  
Computationally intensive tools play an increasingly important role in financial decisions. Many financial problems ranging from asset allocation to risk management and from option pricing to model calibration can be efficiently handled using modern computational techniques. *Numerical Methods and Optimization in Finance* presents such computational techniques with an emphasis on simulation and optimization, particularly so-called heuristics. This book treats quantitative analysis as an essentially computational discipline in which applications are put into software form and tested empirically. This revised edition includes two new chapters: a self-contained tutorial on implementing and using heuristics and an explanation of software used for testing portfolio selection models. Postgraduate students, researchers in programs on quantitative and computational finance, and practitioners in banks and other financial companies can benefit from this second edition of *Numerical Methods and Optimization in Finance*.

*Numerical Methods for Optimization in Finance* Tobias Lipp, 2012  
This dissertation contributes to optimization in finance through numerical methods. The input consists of two parts. In part 1, we propose a numerical method to compute a trading strategy for the hedging of a financial derivative with  $N$  hedging instruments. The underlying mathematical framework is local risk minimization in discrete time. The method combines Monte Carlo simulation with least squares regression in analogy to the method of Longstaff and Schwartz. We study the proposed method on two example problems. For both problems, the number of hedging instruments is two. One of the hedging instruments is always the underlying asset of the hedging objective. The other hedging instrument is a vanilla put option in the first example and a variance swap in the second example. In part 2, we propose an optimal control approach for the optimization of European double barrier basket options. The basket consists of two assets. The objective is to control the payoff and the rebate at the upper barrier such that the delta of the option is as close as possible to a predefined constant. This gives rise to a control-constrained optimal control problem for the two-dimensional Black-Scholes equation with Dirichlet boundary control and finite time control. Based on the variational formulation of the problem in an appropriate Sobolev space setting, we prove the existence of a unique solution and state the first-order necessary optimality conditions. Discretization in space by  $P_1$  finite elements and discretization in time by the backward Euler scheme results in a fully discrete optimal control problem. Numerical results illustrate the benefits of optimized double barrier options.

*Nonlinear Optimization with Financial Applications* Michael Bartholomew-Biggs, 2006-07-21  
The book introduces the key ideas behind practical nonlinear optimization. Computational finance, an increasingly popular area of mathematics degree programs, is combined here with the study of an important class of numerical techniques. The financial content of the book is designed to be relevant and interesting to specialists. However, this material, which occupies about one-third of the text, is also sufficiently accessible to allow the book to be used on optimization courses of a more general nature. The essentials of most currently

popular algorithms are described and their performance is demonstrated on a range of optimization problems arising in financial mathematics. Theoretical convergence properties of methods are stated and formal proofs are provided in enough cases to be instructive rather than overwhelming. Practical behavior of methods is illustrated by computational examples and discussions of efficiency, accuracy and computational costs. Supporting software for the examples and exercises is available but the text does not require the reader to use or understand these particular codes. The author has been active in optimization for over thirty years in algorithm development and application and in teaching and research supervision.

*Handbook of Computational Finance* Jin-Chuan Duan, Wolfgang Karl Härdle, James E. Gentle, 2011-10-25 Any financial asset that is openly traded has a market price Except for extreme market conditions market price may be more or less than a fair value Fair value is likely to be some complicated function of the current intrinsic value of tangible or intangible assets underlying the claim and our assessment of the characteristics of the underlying assets with respect to the expected rate of growth future dividends volatility and other relevant market factors Some of these factors that affect the price can be measured at the time of a transaction with reasonably high accuracy Most factors however relate to expectations about the future and to subjective issues such as current management corporate policies and market environment that could affect the future financial performance of the underlying assets Models are thus needed to describe the stochastic factors and environment and their implementations inevitably require computational finance tools
