[Component-Based Software Engineering](#) Grace A. Lewis,Iman Poernomo,Christine Hofmeister,2009-06-09 The 2009 Symposium on Component Based Software Engineering CBSE 2009 was the 12th in a series of successful events that have grown into the main forum for industrial and academic experts to discuss component technology Component based software engineering CBSE has emerged as the underlying technology for the assembly of flexible software systems In essence CBSE is about composing

computational building blocks to construct larger building blocks that fulfill client needs. Most software engineers are involved in some form of component based development. Nonetheless, the implications of CBSE adoption are wide reaching and its challenges grow in tandem with its uptake, continuing to inspire scientific speculation. Component based development necessarily involves elements of software architecture, modular software design, software verification, testing, configuration, and deployment. This year's submissions represent a cross section of CBSE research that touches upon all these aspects. The theoretical foundations of component specification, composition, and verification continue to pose research challenges. What exactly constitutes an adequate semantics for communication and composition so that bigger things can be built from smaller things? How can formal approaches facilitate predictable assembly through better analysis? We have grouped the proceedings into two sub themes that deal with these issues: component models and communication and composition. At the same time, the world is changing.

**Practical OPNsense** Markus Stubbig, 2019-07-11 Simple packet filters are becoming a thing of the past. Even the open source domain is moving towards Next Generation Firewalls. And OPNsense is a top player when it comes to intrusion detection, application control, web filtering, and anti-virus. No network is too insignificant to be spared by an attacker. Even home networks, washing machines, and smartwatches are threatened and require a secure environment. Firewalls are a component of the security concept. They protect against known and new threats to computers and networks. A firewall offers the highest level of protection if its functions are known. Its operation is simple and it is ideally positioned in the surrounding infrastructure. OPNsense accepts the challenge and meets these criteria in different ways. This book is the ideal companion for understanding, installing, and setting up an OPNsense firewall. Each chapter explains a real world situation, describes the theoretical fundamentals, and presents a laboratory experiment for better understanding. Finally, it offers a solution using OPNsense methods and knowledge from a technical background. The chapters are mostly independent of each other but presented with increasing levels of proficiency. Thus, the topics dealt with are appropriate for beginners to professionals.
