Kocvara,J. Zowe,1998-07-31 This book presents an in depth study and a solution technique for an important class of optimization problems This class is characterized by special constraints parameter dependent convex programs variational inequalities or complementarity problems All these so called equilibrium constraints are mostly treated in a convenient form of generalized equations The book begins with a chapter on auxiliary results followed by a description of the main numerical tools a bundle method of nonsmooth optimization and a nonsmooth variant of Newton s method Following this stability and sensitivity theory for generalized equations is presented based on the concept of strong regularity This enables one to apply the generalized differential calculus for Lipschitz maps to derive optimality conditions and to arrive at a solution method A large part of the book focuses on applications coming from continuum mechanics and mathematical economy A series of nonacademic problems is introduced and analyzed in detail Each problem is accompanied with examples that show the efficiency of the solution method This book is addressed to applied mathematicians and engineers working in continuum mechanics operations research and economic modelling Students interested in optimization will also find the book useful **Variational Methods in Shape Optimization Problems** Dorin Bucur,Giuseppe Buttazzo,2006-09-13 The fascinating eld of shape optimization problems has received a lot of attention in recent years particularly in relation to a number of applications in physics and engineering that require a focus on shapes instead of parameters or functions The goal of these applications is to deform and modify the admissible shapes in order to comply with a given cost function that needs to be optimized In this respect the problems are both classical as the isoperimetric problem and the Newton problem of the ideal aerodynamical shape show and modern re ecting the many results obtained in the last few decades The intriguing feature is that the competing objects are shapes i e domains of N R instead of functions as it usually occurs in problems of the calculus of va ations This constraint often produces additional dif culties that lead to a lack of existence of a solution and to the introduction of suitable relaxed formulations of the problem However in certain limited cases an optimal solution exists

due to the special form of the cost functional and to the geometrical restrictions on the class of competing domains
