Electrical, Geometrical Analogue Techniques for the Solution of Two-directional Complex Heat Conduction Problems Wallace R. Simmons, 1954 Two electrical geometrical analogues are presented for the determination of two directional equipotential patterns of Poissonian fields created by uniformly or nonuniformly distributed sources for steady state or transient conditions The numerical values of the equipotential isothermal lines as applied to heat conduction problems are obtained directly from potential measurements through the use of a standard resistance The accuracy of these techniques is demonstrated by comparing the results from the analogue with the analytical results for a number of steady state transient problems **Variable Degree Schwarz Methods for the**
