Abstract—The purpose of this study was to determine the effect of a 10-week training program on the physical fitness and health of sedentary, middle-aged men. The subjects were 20 men, aged 40–50 years, who were sedentary and had no history of cardiovascular disease. They were randomly assigned to either a control group (n = 10) or a training group (n = 10). The training group participated in a 10-week program of aerobic exercise, three times per week, for 30 minutes per session. The control group did not participate in any exercise program. Physical fitness was assessed at baseline and at 10 weeks using a variety of tests, including a maximal aerobic power test, a submaximal aerobic power test, and a 10-minute step test. Health was assessed at baseline and at 10 weeks using a variety of tests, including a blood pressure measurement, a heart rate measurement, and a cholesterol measurement. The results of the study showed that the training group had significantly higher values for all physical fitness and health measures at 10 weeks compared to baseline and compared to the control group. These findings suggest that a 10-week training program can improve physical fitness and health in sedentary, middle-aged men.
