Neural Masses And Fields In Dynamic Causal Modeling:

Neural Masses and Fields: Modelling the Dynamics of Brain Activity Karl Friston, 2015-05-25 Biophysical modelling of brain activity has a long and illustrious history and has recently profited from technological advances that furnish neuroimaging data at an unprecedented spatiotemporal resolution. Neuronal modelling is a very active area of research with applications ranging from the characterization of neurobiological and cognitive processes to constructing artificial brains in silico and building brain machine interface and neuroprosthetic devices. Biophysical modelling has always benefited from interdisciplinary interactions between different and seemingly distant fields ranging from mathematics and engineering to linguistics and psychology. This Research Topic aims to promote such interactions by promoting papers that contribute to a deeper understanding of neural activity as measured by fMRI or electrophysiology. In general mean field models of neural activity can be divided into two classes neural mass and neural field models. The main difference between these classes is that field models prescribe how a quantity characterizing neural activity such as average depolarization of a neural population evolves over both space and time as opposed to mass models which characterize activity over time only by assuming that all neurons in a population are located at approximately the same point. This Research Topic focuses on both classes of models and considers several aspects and their relative merits that span from synapses to the whole brain. Comparisons of their predictions with EEG and MEG spectra of spontaneous brain activity evoked responses seizures and fitting data to infer brain states and map physiological parameters.

Neural Fields Stephen Coombes, Peter beim Graben, Roland Potthast, James Wright, 2014-06-17 Neural field theory has a long standing tradition in the mathematical and computational neurosciences. Beginning almost 50 years ago with seminal work by Griffiths and culminating in the 1970ties with the models of Wilson and Cowan, Nunez and Amari this important research area experienced a renaissance during the 1990ties by the groups of Ermentrout, Robinson, Bressloff, Wright and Haken. Since then much progress has been made in both the development of mathematical and numerical techniques and in physiological refinement and understanding. In contrast to large scale neural network models described by huge connectivity matrices that are computationally expensive in numerical simulations neural field models described by connectivity kernels allow for analytical treatment by means of methods from functional analysis. Thus a number of rigorous results on the existence of bump and wave solutions or on inverse kernel construction problems are nowadays available. Moreover neural fields provide an important interface for the coupling of neural activity to experimentally observable data such as the electroencephalogram EEG or functional magnetic resonance imaging fMRI. And finally neural fields over rather abstract feature spaces also called dynamic fields found successful applications in the cognitive sciences and in robotics. Up to now research results in neural field theory have been disseminated across a number of distinct journals from mathematics, computational neuroscience, biophysics, cognitive science and others. There is no comprehensive collection of results or reviews available yet. With our proposed book Neural

Imaging the Spatial-temporal Neuronal Dynamics Using Dynamic Causal Modelling C.-C. Chen,2009 Oscillatory brain activity is a ubiquitous feature of neuronal dynamics and the synchronous discharge of neurons is believed to facilitate integration both within functionally segregated brain areas and between areas engaged by the same task There is growing interest in investigating the neural oscillatory networks *in vivo* The aims of this thesis are to 1 develop an advanced method Dynamic Causal Modelling for Induced Responses DCM for IR for modelling the brain network functions and 2 apply it to exploit the nonlinear coupling in the motor system during hand grips and the functional asymmetries during face perception DCM for IR models the time varying power over a range of frequencies of coupled electromagnetic sources The model parameters encode coupling strength among areas and allows the differentiations between linear within frequency and nonlinear between frequency coupling I applied DCM for IR to show that during hand grips the nonlinear interactions among neuronal sources in motor system are essential while intrinsic coupling within source is very likely to be linear Furthermore the normal aging process alters both the network architecture and the frequency contents in the motor network I then use the bilinear form of DCM for IR to model the experimental manipulations as the modulatory effects I use MEG data to demonstrate functional asymmetries between forward and backward connections during face perception Specifically high gamma frequencies in higher cortical areas suppressed low alpha frequencies in lower areas This finding provides direct evidence for functional asymmetries that is consistent with anatomical and physiological evidence from animal studies Lastly I generalize the bilinear form of DCM for IR to dissociate the induced responses from evoked ones in terms of their functional role The backward modulatory effect is expressed as induced but not evoked responses *Aerospace Medicine and Biology ,1990* A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in Scientific and technical aerospace reports STAR and International aerospace abstracts IAA *Yearbook of International Organizations ,2000*
