Transport Daniel M. Suter,Kyle E. Miller,2016-05-26 Understanding the underlying mechanisms of how axons and dendrites
develop is a fundamental problem in neuroscience and a main goal of research on nervous system development and
regeneration Previous studies have provided a tremendous amount of information on signaling and cytoskeletal proteins
regulating axonal and dendritic growth and guidance However relatively little is known about the relative contribution and
role of cytoskeletal dynamics transport of organelles and cytoskeletal components and force generation to axonal elongation
Advancing the knowledge of these biomechanical processes is critical to better understand the development of the nervous
system the pathological progression of neurodegenerative diseases acute traumatic injury and for designing novel
approaches to promote neuronal regeneration following disease stroke or trauma Mechanical properties and forces shape the
development of the nervous system from the cellular up to the organ level Recent advances in quantitative live cell imaging
biophysical and nanotechnological methods such as traction force microscopy optical tweezers and atomic force microscopy
have enabled researchers to gain better insights into how cytoskeletal dynamics and motor driven transport membrane
dynamics adhesion and substrate rigidity influence axonal elongation Given the complexity and mechanical nature of this
problem mathematical modeling contributes significantly to our understanding of neuronal mechanics Nonetheless there has
been limited direct interaction and discussions between experimentalists and theoreticians in this research area The purpose
of this Frontiers Research Topic is to highlight exciting and important work that is currently developing in the fields of
